Nucleotide sequence of GAM337428 precursor RNA, designated SEQ ID NO: 6344, and a schematic representation of a predicted secondary folding of GAM337428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337428 folded precursor RNA yielding a GAM337428 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337428 RNA, hereby incorporated herein.

GAM337428 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337428 target RNA, herein designated GAM TARGET RNA.

GAM337428 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337428 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337428 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337428 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337428 RNA, herein designated GAM RNA, to target binding sites on GAM337428 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337428 target RNA into GAM337428 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337428 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337428 target genes. The mRNA of each one of this plurality of GAM337428 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337428 RNA, herein designated GAM RNA, and which when bound by GAM337428 RNA causes inhibition of translation of the GAM337428 target mRNA into a corresponding GAM337428 target protein.

The mechanism of the translational inhibition exerted by GAM337428 RNA, herein designated GAM RNA, on one or more GAM337428 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337428 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337428 RNA, herein designated GAM RNA, of GAM337428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337428 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337428 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337428 RNA correlate with, and may be deduced from, the identity of the GAM337428 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337429 6152 CTAGAGTCCC Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTCAGCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGGGGAGCTT Messenger 337429 (GAM337429) oligonucleotides modulates expression of respective target
TCAAATTTGA genes whose function and utility is known in the art.

AATCAGGAGA GAM337429 is a novel bioinformatically detectable regulatory, non protein
CTCGAATTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337429 was detected
AGTTTTTCCT is described with additional reference to Figs. 9-15.

ACCCCTTAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTGTGGGAC encoded by the human genome.

TTTAG GAM337429 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337429 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337429 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337429 precursor RNA is designated SEQ ID:6152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6152 is located from position 112396737 to position 112396831 relative to chromosome 9 on the `+` strand.

GAM337429 precursor RNA folds onto itself, forming GAM337429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337429 precursor RNA, designated SEQ ID NO: 6152, and a schematic representation of a predicted secondary folding of GAM337429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337429 folded precursor RNA yielding a GAM337429 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337429 RNA, hereby incorporated herein.

GAM337429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337429 target RNA, herein designated GAM TARGET RNA.

GAM337429 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337429 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337429 RNA, herein designated GAM RNA, to target binding sites on GAM337429 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337429 target RNA into GAM337429 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337429 target genes. The mRNA of each one of this plurality of GAM337429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337429 RNA, herein designated GAM RNA, and which when bound by GAM337429 RNA causes inhibition of translation of the GAM337429 target mRNA into a corresponding GAM337429 target protein.

The mechanism of the translational inhibition exerted by GAM337429 RNA, herein designated GAM RNA, on one or more GAM337429 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337429 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337429 RNA, herein designated GAM RNA, of GAM337429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337429 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337429 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337429 RNA correlate with, and may be deduced from, the identity of the GAM337429 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337430 6900 GTGATTCAGC Fig. 8 further provides a conceptual description of another novel bioinformatically
CAGACGTGAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAGGAAATG Messenger 337430 (GAM337430) oligonucleotides modulates expression of respective target
GTGGTATCTT genes whose function and utility is known in the art.

GTGTTATTAA GAM337430 is a novel bioinformatically detectable regulatory, non protein
GCACTTGAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337430 was detected
TTGGTTGATG is described with additional reference to Figs. 9-15.

CACTGCAGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTAATAAAT encoded by the human genome.

TTCCAATATC GAM337430 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAGAAGAACA GAM337430 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TGCTGAAGAA GAM337430 precursor RNA does not encode a protein. A nucleotide sequence identical or

T highly similar to the nucleotide sequence of GAM337430 precursor RNA is designated SEQ ID:6900, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6900 is located from position 112469045 to position 112469165 relative to chromosome 12 on the `-` strand.

GAM337430 precursor RNA folds onto itself, forming GAM337430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337430 precursor RNA, designated SEQ ID NO: 6900, and a schematic representation of a predicted secondary folding of GAM337430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337430 folded precursor RNA yielding a GAM337430 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337430 RNA, hereby incorporated herein.

GAM337430 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337430 target RNA, herein designated GAM TARGET RNA.

GAM337430 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337430 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337430 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337430 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337430 RNA, herein designated GAM RNA, to target binding sites on GAM337430 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337430 target RNA into GAM337430 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337430 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337430 target genes. The mRNA of each one of this plurality of GAM337430 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337430 RNA, herein designated GAM RNA, and which when bound by GAM337430 RNA causes inhibition of translation of the GAM337430 target mRNA into a corresponding GAM337430 target protein.

The mechanism of the translational inhibition exerted by GAM337430 RNA, herein designated GAM RNA, on one or more GAM337430 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337430 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337430 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337430 RNA, herein designated GAM RNA, of GAM337430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337430 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337430 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337430 RNA correlate with, and may be deduced from, the identity of the GAM337430 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337431 7292 TTCAGCCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CGTGATGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAATGGTGG Messenger 337431 (GAM337431) oligonucleotides modulates expression of respective target

TATCTTGTGT genes whose function and utility is known in the art.

TATTAAGCAC GAM337431 is a novel bioinformatically detectable regulatory, non protein

TTGAACTTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337431 was detected

TTGATGCACT is described with additional reference to Figs. 9-15.

GCAGTCTCTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATAAATTTCC encoded by the human genome.

AATATCAAGA GAM337431 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AGAACATGCT GAM337431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAA GAM337431 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337431 precursor RNA is designated SEQ ID:7292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7292 is located from position 112469049 to position 112469161 relative to chromosome 12 on the `-` strand.

GAM337431 precursor RNA folds onto itself, forming GAM337431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337431 precursor RNA, designated SEQ ID NO: 7292, and a schematic representation of a predicted secondary folding of GAM337431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337431 folded precursor RNA yielding a GAM337431 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337431 RNA, hereby incorporated herein.

GAM337431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337431 target RNA, herein designated GAM TARGET RNA.

GAM337431 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337431 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337431 RNA, herein designated GAM RNA, to target binding sites on GAM337431 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337431 target RNA into GAM337431 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337431 target genes. The mRNA of each one of this plurality of GAM337431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337431 RNA, herein designated GAM RNA, and which when bound by GAM337431 RNA causes inhibition of translation of the GAM337431 target mRNA into a corresponding GAM337431 target protein.

The mechanism of the translational inhibition exerted by GAM337431 RNA, herein designated GAM RNA, on one or more GAM337431 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337431 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337431 RNA, herein designated GAM RNA, of GAM337431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337431 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337431 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337431 RNA correlate with, and may be deduced from, the identity of the GAM337431 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337432 7009 TCAGCCAGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGATGGAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAATGGTGGT Messenger 337432 (GAM337432) oligonucleotides modulates expression of respective target

ATCTTGTGTT genes whose function and utility is known in the art.

ATTAAGCACT GAM337432 is a novel bioinformatically detectable regulatory, non protein

TGAACTTGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337432 was detected

TGATGCACTG is described with additional reference to Figs. 9-15.

CAGTCTCTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAAATTTCCA encoded by the human genome.

ATATCAAGAA GAM337432 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAACATGCTG GAM337432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

A GAM337432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337432 precursor RNA is designated SEQ

ID:7009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7009 is located from position 112469050 to position 112469160 relative to chromosome 12 on the `-` strand.

GAM337432 precursor RNA folds onto itself, forming GAM337432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337432 precursor RNA, designated SEQ ID NO: 7009, and a schematic representation of a predicted secondary folding of GAM337432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337432 folded precursor RNA yielding a GAM337432 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337432 RNA, hereby incorporated herein.

GAM337432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337432 target RNA, herein designated GAM TARGET RNA.

GAM337432 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337432 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337432 RNA, herein designated GAM RNA, to target binding sites on GAM337432 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337432 target RNA into GAM337432 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337432 target genes. The mRNA of each one of this plurality of GAM337432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337432 RNA, herein designated GAM RNA, and which when bound by GAM337432 RNA causes inhibition of translation of the GAM337432 target mRNA into a corresponding GAM337432 target protein.

The mechanism of the translational inhibition exerted by GAM337432 RNA, herein designated GAM RNA, on one or more GAM337432 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337432 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337432 RNA, herein designated GAM RNA, of GAM337432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337432 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337432 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337432 RNA correlate with, and may be deduced from, the identity of the GAM337432 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337433 7191 TGATGGAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGGTGGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTTGTGTTA Messenger 337433 (GAM337433) oligonucleotides modulates expression of respective target

TTAAGCACTT genes whose function and utility is known in the art.

GAACTTGGTT GAM337433 is a novel bioinformatically detectable regulatory, non protein

GATGCACTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337433 was detected

AGTCTCTAAT is described with additional reference to Figs. 9-15.

AAATTTCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TATCA encoded by the human genome.

GAM337433 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337433 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337433 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337433 precursor RNA is designated SEQ ID:7191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7191 is located from position 112469065 to position 112469149 relative to chromosome 12 on the `-` strand.

GAM337433 precursor RNA folds onto itself, forming GAM337433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337433 precursor RNA, designated SEQ ID NO: 7191, and a schematic representation of a predicted secondary folding of GAM337433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337433 folded precursor RNA yielding a GAM337433 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337433 RNA, hereby incorporated herein.

GAM337433 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337433 target RNA, herein designated GAM TARGET RNA.

GAM337433 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337433 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337433 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337433 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337433 RNA, herein designated GAM RNA, to target binding sites on GAM337433 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337433 target RNA into GAM337433 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337433 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337433 target genes. The mRNA of each one of this plurality of GAM337433 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337433 RNA, herein designated GAM RNA, and which when bound by GAM337433 RNA causes inhibition of translation of the GAM337433 target mRNA into a corresponding GAM337433 target protein.

The mechanism of the translational inhibition exerted by GAM337433 RNA, herein designated GAM RNA, on one or more GAM337433 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337433 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337433 RNA, herein designated GAM RNA, of GAM337433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337433 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337433 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337433 RNA correlate with, and may be deduced from, the identity of the GAM337433 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337435 5917 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337435 (GAM337435) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337435 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337435 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337435 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337435 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337435 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337435 precursor RNA is designated SEQ ID:5917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5917 is located from position 112801451 to position 112801532 relative to chromosome 11 on the `+` strand.

GAM337435 precursor RNA folds onto itself, forming GAM337435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337435 precursor RNA, designated SEQ ID NO: 5917, and a schematic representation of a predicted secondary folding of GAM337435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337435 folded precursor RNA yielding a GAM337435 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337435 RNA, hereby incorporated herein.

GAM337435 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337435 target RNA, herein designated GAM TARGET RNA.

GAM337435 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337435 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337435 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337435 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337435 RNA, herein designated GAM RNA, to target binding sites on GAM337435 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337435 target RNA into GAM337435 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337435 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337435 target genes. The mRNA of each one of this plurality of GAM337435 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337435 RNA, herein designated GAM RNA, and which when bound by GAM337435 RNA causes inhibition of translation of the GAM337435 target mRNA into a corresponding GAM337435 target protein.

The mechanism of the translational inhibition exerted by GAM337435 RNA, herein designated GAM RNA, on one or more GAM337435 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337435 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337435 RNA, herein designated GAM RNA, of GAM337435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337435 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337435 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337435 RNA correlate with, and may be deduced from, the identity of the GAM337435 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337437 7219 TGGAGCTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGGTAAAATA detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGTGTACTT Messenger 337437 (GAM337437) oligonucleotides modulates expression of respective target
GTCTTAGTTT genes whose function and utility is known in the art.

GCTCTTTTCC GAM337437 is a novel bioinformatically detectable regulatory, non protein
AAGTTGAAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337437 was detected
CTGGCAGATT is described with additional reference to Figs. 9-15.

TCACCAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGTGTCTG encoded by the human genome.

CCCCCACCTC GAM337437 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM337437 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337437 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337437 precursor RNA is designated SEQ ID:7219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7219 is located from position 112997384 to position 112997485 relative to chromosome 13 on the `+` strand.

GAM337437 precursor RNA folds onto itself, forming GAM337437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337437 precursor RNA, designated SEQ ID NO: 7219, and a schematic representation of a predicted secondary folding of GAM337437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337437 folded precursor RNA yielding a GAM337437 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337437 RNA, hereby incorporated herein.

GAM337437 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337437 target RNA, herein designated GAM TARGET RNA.

GAM337437 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337437 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337437 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337437 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337437 RNA, herein designated GAM RNA, to target binding sites on GAM337437 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337437 target RNA into GAM337437 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337437 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337437 target genes. The mRNA of each one of this plurality of GAM337437 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337437 RNA, herein designated GAM RNA, and which when bound by GAM337437 RNA causes inhibition of translation of the GAM337437 target mRNA into a corresponding GAM337437 target protein.

The mechanism of the translational inhibition exerted by GAM337437 RNA, herein designated GAM RNA, on one or more GAM337437 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337437 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337437 RNA, herein designated GAM RNA, of GAM337437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337437 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337437 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337437 RNA correlate with, and may be deduced from, the identity of the GAM337437 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337438 7184 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACTCGGGAG Messenger 337438 (GAM337438) oligonucleotides modulates expression of respective target
GGGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM337438 is a novel bioinformatically detectable regulatory, non protein
GATCACACAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337438 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAAGTGA encoded by the human genome.

GACCCCCATC GAM337438 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCA GAM337438 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337438 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337438 precursor RNA is designated SEQ ID:7184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7184 is located from position 113030916 to position 113031018 relative to chromosome 2 on the `-` strand.

GAM337438 precursor RNA folds onto itself, forming GAM337438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337438 precursor RNA, designated SEQ ID NO: 7184, and a schematic representation of a predicted secondary folding of GAM337438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337438 folded precursor RNA yielding a GAM337438 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337438 RNA, hereby incorporated herein. Expression of GAM337438 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337438 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337438 target RNA, herein designated GAM TARGET RNA.

GAM337438 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337438 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337438 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337438 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337438 RNA, herein designated GAM RNA, to target binding sites on GAM337438 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337438 target RNA into GAM337438 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337438 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337438 target genes. The mRNA of each one of this plurality of GAM337438 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337438 RNA, herein designated GAM RNA, and which when bound by GAM337438 RNA causes inhibition of translation of the GAM337438 target mRNA into a corresponding GAM337438 target protein.

The mechanism of the translational inhibition exerted by GAM337438 RNA, herein designated GAM RNA, on one or more GAM337438 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337438 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337438 RNA, herein designated GAM RNA, of GAM337438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337438 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337438 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337438 RNA correlate with, and may be deduced from, the identity of the GAM337438 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGAACTCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGGGAGGC Messenger 337439 (GAM337439) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACA GAM337439 is a novel bioinformatically detectable regulatory, non protein

CACCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337439 was detected

CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACC encoded by the human genome.

GAM337439 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337439 precursor RNA is designated SEQ ID:6662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6662 is located from position 113030925 to position 113031011 relative to chromosome 2 on the `-` strand.

GAM337439 precursor RNA folds onto itself, forming GAM337439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337439 precursor RNA, designated SEQ ID NO: 6662, and a schematic representation of a predicted secondary folding of GAM337439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337439 folded precursor RNA yielding a GAM337439 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337439 RNA, hereby incorporated herein. Expression of GAM337439 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337439 target RNA, herein designated GAM TARGET RNA.

GAM337439 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337439 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337439 RNA, herein designated GAM RNA, to target binding sites on GAM337439 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337439 target RNA into GAM337439 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337439 target genes. The mRNA of each one of this plurality of GAM337439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337439 RNA, herein designated GAM RNA, and which when bound by GAM337439 RNA causes inhibition of translation of the GAM337439 target mRNA into a corresponding GAM337439 target protein.

The mechanism of the translational inhibition exerted by GAM337439 RNA, herein

designated GAM RNA, on one or more GAM337439 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337439 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337439 RNA, herein designated GAM RNA, of GAM337439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337439 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337439 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337439 RNA correlate with, and may be deduced from, the identity of the GAM337439 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337440 was detected
CCTGGGCAAC is described with additional reference to Figs. 9-15.

AAAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337440 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337440 precursor RNA is designated SEQ ID:7058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7058 is located from position 113030929 to position 113031005

relative to chromosome 2 on the `-` strand.

GAM337440 precursor RNA folds onto itself, forming GAM337440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337440 precursor RNA, designated SEQ ID NO: 7058, and a schematic representation of a predicted secondary folding of GAM337440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337440 folded precursor RNA yielding a GAM337440 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337440 RNA, hereby incorporated herein. Expression of GAM337440 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337440 target RNA, herein designated GAM TARGET RNA.

GAM337440 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337440 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337440 RNA, herein designated GAM RNA, to target binding sites on GAM337440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337440 target RNA into GAM337440 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337440 target genes. The mRNA of each one of this plurality of GAM337440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337440 RNA, herein designated GAM RNA, and which when bound by GAM337440 RNA causes inhibition of translation of the GAM337440 target mRNA into a corresponding GAM337440 target protein.

The mechanism of the translational inhibition exerted by GAM337440 RNA, herein designated GAM RNA, on one or more GAM337440 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337440 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337440 RNA, herein designated GAM RNA, of GAM337440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337440 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337440 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337440 RNA correlate with, and may be deduced from, the identity of the GAM337440 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTCTGCCTGC Messenger 337441 (GAM337441) oligonucleotides modulates expression of respective target

AGTCCTGCTT genes whose function and utility is known in the art.

TGTTTTGGAC GAM337441 is a novel bioinformatically detectable regulatory, non protein

AAGTAGGAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337441 was detected

GACAAGCAGG is described with additional reference to Figs. 9-15.

TCAGCACAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTT encoded by the human genome.

GAM337441 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337441 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337441 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337441 precursor RNA is designated SEQ ID:5789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5789 is located from position 113128395 to position 113128478 relative to chromosome 11 on the `+` strand.

GAM337441 precursor RNA folds onto itself, forming GAM337441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337441 precursor RNA, designated SEQ ID NO: 5789, and a schematic representation of a predicted secondary folding of GAM337441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337441 folded precursor RNA yielding a GAM337441 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337441 RNA, hereby incorporated herein.

GAM337441 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337441 target RNA, herein designated GAM TARGET RNA.

GAM337441 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337441 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337441 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337441 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337441 RNA, herein designated GAM RNA, to target binding sites on GAM337441 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337441 target RNA into GAM337441 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337441 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337441 target genes. The mRNA of each one of this plurality of GAM337441 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337441 RNA, herein designated GAM RNA, and which when bound by GAM337441 RNA causes inhibition of translation of the GAM337441 target mRNA into a corresponding GAM337441 target protein.

The mechanism of the translational inhibition exerted by GAM337441 RNA, herein designated GAM RNA, on one or more GAM337441 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337441 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337441 RNA, herein designated GAM RNA, of GAM337441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337441 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337441 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337441 RNA correlate with, and may be deduced from, the identity of the GAM337441 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTCCTGCTTT genes whose function and utility is known in the art.

GTTTTGGACA AGTAGGAGTG ACAAGCAGGT CAGCACAGCC CT

GAM337442 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337442 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337442 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337442 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337442 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337442 precursor RNA is designated SEQ ID:6819, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6819 is located from position 113128396 to position 113128477 relative to chromosome 11 on the `+` strand.

GAM337442 precursor RNA folds onto itself, forming GAM337442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337442 precursor RNA, designated SEQ ID NO: 6819, and a schematic representation of a predicted secondary folding of GAM337442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337442 folded precursor RNA yielding a GAM337442 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337442 RNA, hereby incorporated herein.

GAM337442 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337442 target RNA, herein designated GAM TARGET RNA.

GAM337442 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337442 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337442 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337442 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337442 RNA, herein designated GAM RNA, to target binding sites on GAM337442 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337442 target RNA into GAM337442 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337442 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337442 target genes. The mRNA of each one of this plurality of GAM337442 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337442 RNA, herein designated GAM RNA, and which when bound by GAM337442 RNA causes inhibition of translation of the GAM337442 target mRNA into a corresponding GAM337442 target protein.

The mechanism of the translational inhibition exerted by GAM337442 RNA, herein designated GAM RNA, on one or more GAM337442 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337442 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337442 RNA, herein designated GAM RNA, of GAM337442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337442 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337442 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337442 RNA correlate with, and may be deduced from, the identity of the GAM337442 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337443 6827 GGGTTGTCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTTGGACAA GAM337443 is a novel bioinformatically detectable regulatory, non protein
GTAGGAGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337443 was detected
CAAGCAGGTC is described with additional reference to Figs. 9-15.

AGCACAGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337443 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337443 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337443 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337443 precursor RNA is designated SEQ ID:6827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6827 is located from position 113128397 to position 113128476 relative to chromosome 11 on the `+` strand.

GAM337443 precursor RNA folds onto itself, forming GAM337443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337443 precursor RNA, designated SEQ ID NO: 6827, and a schematic representation of a predicted secondary folding of GAM337443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337443 folded precursor RNA yielding a GAM337443 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337443 RNA, hereby incorporated herein.

GAM337443 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337443 target RNA, herein designated GAM TARGET RNA.

GAM337443 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337443 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337443 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337443 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337443 RNA, herein designated GAM RNA, to target binding sites on GAM337443 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337443 target RNA into GAM337443 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337443 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337443 target genes. The mRNA of each one of this plurality of GAM337443 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337443 RNA, herein designated GAM RNA, and which when bound by GAM337443 RNA causes inhibition of translation of the GAM337443 target mRNA into a corresponding GAM337443 target protein.

The mechanism of the translational inhibition exerted by GAM337443 RNA, herein designated GAM RNA, on one or more GAM337443 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337443 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337443 RNA, herein designated GAM RNA, of GAM337443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337443 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337443 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337443 RNA correlate with, and may be deduced from, the identity of the GAM337443 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTGAGACTCC encoded by the human genome.

GAM337446 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337446 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337446 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337446 precursor RNA is designated SEQ ID:6611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6611 is located from position 113861407 to position 113861496 relative to chromosome 7 on the `+` strand.

GAM337446 precursor RNA folds onto itself, forming GAM337446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337446 precursor RNA, designated SEQ ID NO: 6611, and a schematic representation of a predicted secondary folding of GAM337446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337446 folded precursor RNA yielding a GAM337446 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337446 RNA, hereby incorporated herein. Expression of GAM337446 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337446 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337446 target RNA, herein designated GAM TARGET RNA.

GAM337446 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337446 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337446 RNA, herein designated GAM RNA, to target binding sites on GAM337446 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337446 target RNA into GAM337446 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337446 target genes. The mRNA of each one of this plurality of GAM337446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337446 RNA, herein designated GAM RNA, and which when bound by GAM337446 RNA causes inhibition of translation of the GAM337446 target mRNA into a corresponding GAM337446 target protein.

The mechanism of the translational inhibition exerted by GAM337446 RNA, herein designated GAM RNA, on one or more GAM337446 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337446 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337446 RNA, herein designated GAM RNA, of GAM337446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337446 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337446 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337446 RNA correlate with, and may be deduced from, the identity of the GAM337446 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337447 (GAM337447) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337447 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337447 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337447 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337447 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337447 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337447 precursor RNA is designated SEQ ID:7001, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7001 is located from position 113861413 to position 113861490 relative to chromosome 7 on the `+` strand.

GAM337447 precursor RNA folds onto itself, forming GAM337447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337447 precursor RNA, designated SEQ ID NO: 7001, and a schematic representation of a predicted secondary folding of GAM337447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337447 folded precursor RNA yielding a GAM337447 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337447 RNA, hereby incorporated herein. Expression of GAM337447 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337447 target RNA, herein designated GAM TARGET RNA.

GAM337447 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337447 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337447 RNA, herein designated GAM RNA, to target binding sites on GAM337447 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337447 target RNA into GAM337447 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337447 target genes. The mRNA of each one of this plurality of GAM337447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337447 RNA,

herein designated GAM RNA, and which when bound by GAM337447 RNA causes inhibition of translation of the GAM337447 target mRNA into a corresponding GAM337447 target protein.

The mechanism of the translational inhibition exerted by GAM337447 RNA, herein designated GAM RNA, on one or more GAM337447 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337447 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337447 RNA, herein designated GAM RNA, of GAM337447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337447 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337447 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337447 RNA correlate with, and may be deduced from, the identity of the GAM337447 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337448 6260 CTTGAACCCG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAGGCGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTTGCAGTG Messenger 337448 (GAM337448) oligonucleotides modulates expression of respective target

AGCCGAGATC genes whose function and utility is known in the art.

GTGCCACTGC GAM337448 is a novel bioinformatically detectable regulatory, non protein

ACTCCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337448 was detected

GGGCAACAAG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337448 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337448 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337448 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337448 precursor RNA is designated SEQ ID:6260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6260 is located from position 113861416 to position 113861485 relative to chromosome 7 on the `+` strand.

GAM337448 precursor RNA folds onto itself, forming GAM337448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337448 precursor RNA, designated SEQ ID NO: 6260, and a schematic representation of a predicted secondary folding of GAM337448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337448 folded precursor RNA yielding a GAM337448 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337448 RNA, hereby incorporated herein. Expression of GAM337448 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337448 target RNA, herein designated GAM TARGET RNA.

GAM337448 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337448 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337448 RNA, herein designated GAM RNA, to target binding sites on GAM337448 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337448 target RNA into GAM337448 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337448 target genes. The mRNA of each one of this plurality of GAM337448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337448 RNA, herein designated GAM RNA, and which when bound by GAM337448 RNA causes inhibition of translation of the GAM337448 target mRNA into a corresponding GAM337448 target protein.

The mechanism of the translational inhibition exerted by GAM337448 RNA, herein designated GAM RNA, on one or more GAM337448 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337448 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337448 RNA, herein designated GAM RNA, of GAM337448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337448 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337448 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337448 RNA correlate with, and may be deduced from, the identity of the GAM337448 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337449 5918 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337449 (GAM337449) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337449 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337449 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337449 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337449 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337449 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337449 precursor RNA is designated SEQ ID:5918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5918 is located from position 114300062 to position 114300143 relative to chromosome X on the `-` strand.

GAM337449 precursor RNA folds onto itself, forming GAM337449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337449 precursor RNA, designated SEQ ID NO: 5918, and a schematic representation of a predicted secondary folding of GAM337449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337449 folded precursor RNA yielding a GAM337449 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337449 RNA, hereby incorporated herein.

GAM337449 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337449 target RNA, herein designated GAM TARGET RNA.

GAM337449 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337449 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337449 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337449 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337449 RNA, herein designated GAM RNA, to target binding sites on GAM337449 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337449 target RNA into GAM337449 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337449 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337449 target genes. The mRNA of each one of this plurality of GAM337449 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337449 RNA, herein designated GAM RNA, and which when bound by GAM337449 RNA causes inhibition of translation of the GAM337449 target mRNA into a corresponding GAM337449 target protein.

The mechanism of the translational inhibition exerted by GAM337449 RNA, herein designated GAM RNA, on one or more GAM337449 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337449 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337449 RNA, herein designated GAM RNA, of GAM337449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337449 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337449 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337449 RNA correlate with, and may be deduced from, the identity of the GAM337449 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TAAGTACTGT encoded by the human genome.

CCAGGCA GAM337450 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337450 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337450 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337450 precursor RNA is designated SEQ ID:7200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7200 is located from position 114520290 to position 114520386 relative to chromosome 12 on the `+` strand.

GAM337450 precursor RNA folds onto itself, forming GAM337450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337450 precursor RNA, designated SEQ ID NO: 7200, and a schematic representation of a predicted secondary folding of GAM337450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337450 folded precursor RNA yielding a GAM337450 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337450 RNA, hereby incorporated herein.

GAM337450 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337450 target RNA, herein designated GAM TARGET RNA.

GAM337450 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337450 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337450 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337450 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337450 RNA, herein designated GAM RNA, to target binding sites on GAM337450 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337450 target RNA into GAM337450 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337450 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337450 target genes. The mRNA of each one of this plurality of GAM337450 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337450 RNA, herein designated GAM RNA, and which when bound by GAM337450 RNA causes inhibition of translation of the GAM337450 target mRNA into a corresponding GAM337450 target protein.

The mechanism of the translational inhibition exerted by GAM337450 RNA, herein designated GAM RNA, on one or more GAM337450 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337450 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337450 RNA, herein designated GAM RNA, of GAM337450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337450 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337450 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337450 RNA correlate with, and may be deduced from, the identity of the GAM337450 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337452 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337452 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337452 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337452 precursor RNA is designated SEQ ID:6808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6808 is located from position 115482747 to position 115482828 relative to chromosome 10 on the `-` strand.

GAM337452 precursor RNA folds onto itself, forming GAM337452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337452 precursor RNA, designated SEQ ID NO: 6808, and a schematic representation of a predicted secondary folding of GAM337452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337452 folded precursor RNA yielding a GAM337452 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337452 RNA, hereby incorporated herein.

GAM337452 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337452 target RNA, herein designated GAM TARGET RNA.

GAM337452 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337452 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337452 RNA, herein designated GAM RNA, to target binding sites on GAM337452 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337452 target RNA into GAM337452 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337452 target genes. The mRNA of each one of this plurality of GAM337452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337452 RNA, herein designated GAM RNA, and which when bound by GAM337452 RNA causes inhibition of translation of the GAM337452 target mRNA into a corresponding GAM337452 target protein.

The mechanism of the translational inhibition exerted by GAM337452 RNA, herein designated GAM RNA, on one or more GAM337452 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337452 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337452 RNA, herein designated GAM RNA, of GAM337452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337452 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337452 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337452 RNA correlate with, and may be deduced from, the identity of the GAM337452 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337453 7151 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGGTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 337453 (GAM337453) oligonucleotides modulates expression of respective target
GCAGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCCG GAM337453 is a novel bioinformatically detectable regulatory, non protein
AGATCGTACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337453 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCAA encoded by the human genome.

AACTCCGTCT GAM337453 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM337453 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337453 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337453 precursor RNA is designated SEQ ID:7151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7151 is located from position 116189890 to position 116189991 relative to chromosome 1 on the `-` strand.

GAM337453 precursor RNA folds onto itself, forming GAM337453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337453 precursor RNA, designated SEQ ID NO: 7151, and a schematic representation of a predicted secondary folding of GAM337453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337453 folded precursor

RNA yielding a GAM337453 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337453 RNA, hereby incorporated herein. Expression of GAM337453 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337453 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337453 target RNA, herein designated GAM TARGET RNA.

GAM337453 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337453 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337453 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337453 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337453 RNA, herein designated GAM RNA, to target binding sites on GAM337453 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337453 target RNA into GAM337453 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337453 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337453 target genes. The mRNA of each one of this plurality of GAM337453 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337453 RNA, herein designated GAM RNA, and which when bound by GAM337453 RNA causes inhibition of translation of the GAM337453 target mRNA into a corresponding GAM337453 target protein.

The mechanism of the translational inhibition exerted by GAM337453 RNA, herein designated GAM RNA, on one or more GAM337453 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337453 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337453 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337453 RNA, herein designated GAM RNA, of GAM337453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337453 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337453 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337453 RNA correlate with, and may be deduced from, the identity of the GAM337453 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337454 6405 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATCGGTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
ACCCAGGAGG Messenger 337454 (GAM337454) oligonucleotides modulates expression of respective target
CAGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCGA GAM337454 is a novel bioinformatically detectable regulatory, non protein
GATCGTACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337454 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCAAA encoded by the human genome.

ACTCCGTCTC GAM337454 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337454 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337454 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337454 precursor RNA is designated SEQ ID:6405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6405 is located from position 116189891 to position 116189990 relative to chromosome 1 on the `-` strand.

GAM337454 precursor RNA folds onto itself, forming GAM337454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337454 precursor RNA, designated SEQ ID NO: 6405, and a schematic representation of a predicted secondary folding of GAM337454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337454 folded precursor RNA yielding a GAM337454 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337454 RNA, hereby incorporated herein. Expression of GAM337454 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337454 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337454 target RNA, herein designated GAM TARGET RNA.

GAM337454 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337454 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337454 RNA, herein designated GAM RNA, to target binding sites on GAM337454 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337454 target RNA into GAM337454 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337454 target genes. The mRNA of each one of this plurality of GAM337454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337454 RNA, herein designated GAM RNA, and which when bound by GAM337454 RNA causes inhibition of

translation of the GAM337454 target mRNA into a corresponding GAM337454 target protein.

The mechanism of the translational inhibition exerted by GAM337454 RNA, herein designated GAM RNA, on one or more GAM337454 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337454 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337454 RNA, herein designated GAM RNA, of GAM337454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337454 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337454 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337454 RNA correlate with, and may be deduced from, the identity of the GAM337454 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337456 7123 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCAGGAG Messenger 337456 (GAM337456) oligonucleotides modulates expression of respective target
TTTGAGGCTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM337456 is a novel bioinformatically detectable regulatory, non protein
AGATCACGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337456 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

ACCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCAAG encoded by the human genome.

ATCTTGTCTC GAM337456 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

G GAM337456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337456 precursor RNA is designated SEQ ID:7123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7123 is located from position 116582532 to position 116582632 relative to chromosome 12 on the `-` strand.

GAM337456 precursor RNA folds onto itself, forming GAM337456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337456 precursor RNA, designated SEQ ID NO: 7123, and a schematic representation of a predicted secondary folding of GAM337456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337456 folded precursor RNA yielding a GAM337456 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337456 RNA, hereby incorporated herein.

GAM337456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337456 target RNA, herein designated GAM TARGET RNA.

GAM337456 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337456 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337456 RNA, herein designated GAM RNA, to target binding sites on GAM337456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337456 target RNA

into GAM337456 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337456 target genes. The mRNA of each one of this plurality of GAM337456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337456 RNA, herein designated GAM RNA, and which when bound by GAM337456 RNA causes inhibition of translation of the GAM337456 target mRNA into a corresponding GAM337456 target protein.

The mechanism of the translational inhibition exerted by GAM337456 RNA, herein designated GAM RNA, on one or more GAM337456 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337456 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337456 RNA, herein designated GAM RNA, of GAM337456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337456 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337456 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337456 RNA correlate with, and may be deduced from, the identity of the GAM337456 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337457 6379 GAGGCAGGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGT Messenger 337457 (GAM337457) oligonucleotides modulates expression of respective target

TTGAGGCTGC genes whose function and utility is known in the art.

AGTGAGCCGA GAM337457 is a novel bioinformatically detectable regulatory, non protein

GATCACGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337457 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

CCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGCAAGA encoded by the human genome.

TCTTGTCTC GAM337457 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337457 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337457 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337457 precursor RNA is designated SEQ ID:6379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6379 is located from position 116582533 to position 116582631 relative to chromosome 12 on the `-` strand.

GAM337457 precursor RNA folds onto itself, forming GAM337457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337457 precursor RNA, designated SEQ ID NO: 6379, and a schematic representation of a predicted secondary folding of GAM337457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337457 folded precursor RNA yielding a GAM337457 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337457 RNA, hereby incorporated herein.

GAM337457 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337457 target RNA, herein designated GAM TARGET RNA.

GAM337457 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337457 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337457 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337457 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337457 RNA, herein designated GAM RNA, to target binding sites on GAM337457 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337457 target RNA into GAM337457 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337457 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337457 target genes. The mRNA of each one of this plurality of GAM337457 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337457 RNA, herein designated GAM RNA, and which when bound by GAM337457 RNA causes inhibition of translation of the GAM337457 target mRNA into a corresponding GAM337457 target protein.

The mechanism of the translational inhibition exerted by GAM337457 RNA, herein designated GAM RNA, on one or more GAM337457 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337457 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337457 RNA, herein designated GAM RNA, of GAM337457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337457 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337457 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337457 RNA correlate with, and may be deduced from, the identity of the GAM337457 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337458 5962 ATGAAGTGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCACATTGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TACTGGTGAG Messenger 337458 (GAM337458) oligonucleotides modulates expression of respective target

GAAGGAGCAG genes whose function and utility is known in the art.

AGTTGTGGGC GAM337458 is a novel bioinformatically detectable regulatory, non protein
TGAGACTGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337458 was detected
GCTGTTCAGC is described with additional reference to Figs. 9-15.

ATCTGTCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTGTCACCA encoded by the human genome.

ACATAGATGA GAM337458 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CCACTAGCAT GAM337458 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337458 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337458 precursor RNA is designated SEQ ID:5962, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5962 is located from position 116689623 to position 116689732 relative to chromosome 11 on the `-` strand.

GAM337458 precursor RNA folds onto itself, forming GAM337458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337458 precursor RNA, designated SEQ ID NO: 5962, and a schematic representation of a predicted secondary folding of GAM337458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337458 folded precursor RNA yielding a GAM337458 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337458 RNA, hereby incorporated herein.

GAM337458 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337458 target RNA, herein designated GAM TARGET RNA.

GAM337458 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337458 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337458 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337458 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337458 RNA, herein designated GAM RNA, to target binding sites on GAM337458 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337458 target RNA into GAM337458 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337458 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337458 target genes. The mRNA of each one of this plurality of GAM337458 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337458 RNA, herein designated GAM RNA, and which when bound by GAM337458 RNA causes inhibition of translation of the GAM337458 target mRNA into a corresponding GAM337458 target protein.

The mechanism of the translational inhibition exerted by GAM337458 RNA, herein designated GAM RNA, on one or more GAM337458 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337458 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337458 RNA, herein designated GAM RNA, of GAM337458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337458 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337458 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337458 RNA correlate with, and may be deduced from, the identity of the GAM337458 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTGGGCTGAG GAM337459 is a novel bioinformatically detectable regulatory, non protein
ACTGATGCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337459 was detected
TTCAGCATCT is described with additional reference to Figs. 9-15.

GTCTTCCTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCACCAACAT encoded by the human genome.

AGATGACCAC GAM337459 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
T GAM337459 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337459 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337459 precursor RNA is designated SEQ ID:5814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5814 is located from position 116689628 to position 116689728 relative to chromosome 11 on the `-` strand.

GAM337459 precursor RNA folds onto itself, forming GAM337459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337459 precursor RNA, designated SEQ ID NO: 5814, and a schematic representation of a predicted secondary folding of GAM337459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337459 folded precursor RNA yielding a GAM337459 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337459 RNA, hereby incorporated herein.

GAM337459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337459 target RNA, herein designated GAM TARGET RNA.

GAM337459 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337459 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337459 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337459 RNA, herein designated GAM RNA, to target binding sites on GAM337459 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337459 target RNA into GAM337459 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337459 target genes. The mRNA of each one of this plurality of GAM337459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337459 RNA, herein designated GAM RNA, and which when bound by GAM337459 RNA causes inhibition of translation of the GAM337459 target mRNA into a corresponding GAM337459 target protein.

The mechanism of the translational inhibition exerted by GAM337459 RNA, herein designated GAM RNA, on one or more GAM337459 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337459 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337459 RNA, herein designated GAM RNA, of GAM337459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337459 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337459 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337459 RNA correlate with, and may be deduced from, the identity of the GAM337459 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337460 6999 TCACTTAAAC CCGGGAGGTG GAGGTTGCAG TGAGTGGAGA TGGTGCCACT GCACTCCAGC CTGGGTGACA GAGTGA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337460 (GAM337460) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337460 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337460 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337460 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337460 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337460 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337460 precursor RNA is designated SEQ ID:6999, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6999 is located from position 116939053 to position 116939128 relative to chromosome 9 on the `+` strand.

GAM337460 precursor RNA folds onto itself, forming GAM337460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337460 precursor RNA, designated SEQ ID NO: 6999, and a schematic representation of a predicted secondary folding of GAM337460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337460 folded precursor

RNA yielding a GAM337460 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337460 RNA, hereby incorporated herein.

GAM337460 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337460 target RNA, herein designated GAM TARGET RNA.

GAM337460 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337460 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337460 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337460 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337460 RNA, herein designated GAM RNA, to target binding sites on GAM337460 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337460 target RNA into GAM337460 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337460 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337460 target genes. The mRNA of each one of this plurality of GAM337460 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337460 RNA, herein designated GAM RNA, and which when bound by GAM337460 RNA causes inhibition of translation of the GAM337460 target mRNA into a corresponding GAM337460 target protein.

The mechanism of the translational inhibition exerted by GAM337460 RNA, herein designated GAM RNA, on one or more GAM337460 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337460 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337460 RNA, herein designated GAM RNA, of GAM337460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337460 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337460 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337460 RNA correlate with, and may be deduced from, the identity of the GAM337460 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337461 6738 GGCATCTGTA ATCCCAGCTA CTCGGGAGGC TGAGGCACGA GAATTGCTTG AGCCTGGGAG GTGGAGATTG CAGTGAGTC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337461 (GAM337461) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337461 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337461 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337461 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337461 precursor RNA is designated SEQ ID:6738, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6738 is located from position 116942975 to position 116943053 relative to chromosome X on the `-` strand.

GAM337461 precursor RNA folds onto itself, forming GAM337461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337461 precursor RNA, designated SEQ ID NO: 6738, and a schematic representation of a predicted secondary folding of GAM337461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337461 folded precursor RNA yielding a GAM337461 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337461 RNA, hereby incorporated herein.

GAM337461 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337461 target RNA, herein designated GAM TARGET RNA.

GAM337461 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337461 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337461 RNA, herein designated GAM RNA, to target binding sites on GAM337461 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337461 target RNA into GAM337461 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337461 target genes. The mRNA of each one of this plurality of GAM337461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337461 RNA, herein designated GAM RNA, and which when bound by GAM337461 RNA causes inhibition of translation of the GAM337461 target mRNA into a corresponding GAM337461 target protein.

The mechanism of the translational inhibition exerted by GAM337461 RNA, herein designated GAM RNA, on one or more GAM337461 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337461 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337461 RNA, herein designated GAM RNA, of GAM337461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337461 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337461 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337461 RNA correlate with, and may be deduced from, the identity of the GAM337461 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337462 6687 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 337462 (GAM337462) oligonucleotides modulates expression of respective target

TGAGCCGAGG genes whose function and utility is known in the art.

TTGCGCCATT GAM337462 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337462 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

AGAGCGAAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCC encoded by the human genome.

GAM337462 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337462 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337462 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337462 precursor RNA is designated SEQ ID:6687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6687 is located from position 117189825 to position 117189907 relative to chromosome 9 on the `+` strand.

GAM337462 precursor RNA folds onto itself, forming GAM337462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337462 precursor RNA, designated SEQ ID NO: 6687, and a schematic representation of a predicted secondary folding of GAM337462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337462 folded precursor RNA yielding a GAM337462 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337462 RNA, hereby incorporated herein.

GAM337462 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337462 target RNA, herein designated GAM TARGET RNA.

GAM337462 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337462 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337462 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337462 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337462 RNA, herein designated GAM RNA, to target binding sites on GAM337462 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337462 target RNA into GAM337462 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337462 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337462 target genes. The mRNA of each one of this plurality of GAM337462 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM337462 RNA, herein designated GAM RNA, and which when bound by GAM337462 RNA causes inhibition of translation of the GAM337462 target mRNA into a corresponding GAM337462 target protein.

The mechanism of the translational inhibition exerted by GAM337462 RNA, herein designated GAM RNA, on one or more GAM337462 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337462 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337462 RNA, herein designated GAM RNA, of GAM337462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337462 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337462 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337462 RNA correlate with, and may be deduced from, the identity of the GAM337462 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGAATTGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337463 was detected
TTCTGCCTCT is described with additional reference to Figs. 9-15.

TCCACTACCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTGTGAAAT encoded by the human genome.

TG GAM337463 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337463 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337463 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337463 precursor RNA is designated SEQ ID:6135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6135 is located from position 117327121 to position 117327212 relative to chromosome 9 on the `+` strand.

GAM337463 precursor RNA folds onto itself, forming GAM337463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337463 precursor RNA, designated SEQ ID NO: 6135, and a schematic representation of a predicted secondary folding of GAM337463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337463 folded precursor RNA yielding a GAM337463 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337463 RNA, hereby incorporated herein.

GAM337463 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337463 target RNA, herein designated GAM TARGET RNA.

GAM337463 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337463 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337463 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337463 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337463 RNA, herein designated GAM RNA, to target binding sites on GAM337463 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337463 target RNA

into GAM337463 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337463 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337463 target genes. The mRNA of each one of this plurality of GAM337463 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337463 RNA, herein designated GAM RNA, and which when bound by GAM337463 RNA causes inhibition of translation of the GAM337463 target mRNA into a corresponding GAM337463 target protein.

The mechanism of the translational inhibition exerted by GAM337463 RNA, herein designated GAM RNA, on one or more GAM337463 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337463 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337463 RNA, herein designated GAM RNA, of GAM337463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337463 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337463 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337463 RNA correlate with, and may be deduced from, the identity of the GAM337463 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337464 6489 GCAGCATGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAATAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTATTGGATT Messenger 337464 (GAM337464) oligonucleotides modulates expression of respective target
TGAAATCAGG genes whose function and utility is known in the art.

AGACTTGGAA GAM337464 is a novel bioinformatically detectable regulatory, non protein
TTGAATTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337464 was detected
CCTCTTCCAC is described with additional reference to Figs. 9-15.

TACCAGCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337464 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337464 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337464 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337464 precursor RNA is designated SEQ ID:6489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6489 is located from position 117327126 to position 117327205 relative to chromosome 9 on the `+` strand.

GAM337464 precursor RNA folds onto itself, forming GAM337464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337464 precursor RNA, designated SEQ ID NO: 6489, and a schematic representation of a predicted secondary folding of GAM337464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337464 folded precursor RNA yielding a GAM337464 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337464 RNA, hereby incorporated herein.

GAM337464 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337464 target RNA, herein designated GAM TARGET RNA.

GAM337464 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337464 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337464 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337464 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337464 RNA, herein designated GAM RNA, to target binding sites on GAM337464 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337464 target RNA into GAM337464 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337464 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337464 target genes. The mRNA of each one of this plurality of GAM337464 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337464 RNA, herein designated GAM RNA, and which when bound by GAM337464 RNA causes inhibition of translation of the GAM337464 target mRNA into a corresponding GAM337464 target protein.

The mechanism of the translational inhibition exerted by GAM337464 RNA, herein designated GAM RNA, on one or more GAM337464 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337464 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337464 RNA, herein designated GAM RNA, of GAM337464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337464 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337464 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337464 RNA correlate with, and may be deduced from, the identity of the GAM337464 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337465 5919 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337465 (GAM337465) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337465 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337465 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337465 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337465 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337465 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337465 precursor RNA is designated SEQ ID:5919, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5919 is located from position 117891472 to position 117891553 relative to chromosome 7 on the `-` strand.

GAM337465 precursor RNA folds onto itself, forming GAM337465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337465 precursor RNA, designated SEQ ID NO: 5919, and a schematic representation of a predicted secondary folding of GAM337465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337465 folded precursor RNA yielding a GAM337465 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337465 RNA, hereby incorporated herein.

GAM337465 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337465 target RNA, herein designated GAM TARGET RNA.

GAM337465 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337465 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337465 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337465 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337465 RNA, herein designated GAM RNA, to target binding sites on GAM337465 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337465 target RNA into GAM337465 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337465 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337465 target genes. The mRNA of each one of this plurality of GAM337465 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337465 RNA, herein designated GAM RNA, and which when bound by GAM337465 RNA causes inhibition of translation of the GAM337465 target mRNA into a corresponding GAM337465 target protein.

The mechanism of the translational inhibition exerted by GAM337465 RNA, herein designated GAM RNA, on one or more GAM337465 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337465 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337465 RNA, herein designated GAM RNA, of GAM337465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337465 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337465 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337465 RNA correlate with, and may be deduced from, the identity of the GAM337465 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337466 5920 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337466 (GAM337466) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337466 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337466 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337466 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337466 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337466 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337466 precursor RNA is designated SEQ ID:5920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5920 is located from position 118241872 to position 118241953 relative to chromosome 8 on the `+` strand.

GAM337466 precursor RNA folds onto itself, forming GAM337466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337466 precursor RNA, designated SEQ ID NO: 5920, and a schematic representation of a predicted secondary folding of GAM337466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337466 folded precursor RNA yielding a GAM337466 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337466 RNA, hereby incorporated herein.

GAM337466 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337466 target RNA, herein designated GAM TARGET RNA.

GAM337466 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337466 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337466 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337466 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337466 RNA, herein designated GAM RNA, to target binding sites on GAM337466 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337466 target RNA into GAM337466 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337466 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337466 target genes. The mRNA of each one of this plurality of GAM337466 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337466 RNA, herein designated GAM RNA, and which when bound by GAM337466 RNA causes inhibition of translation of the GAM337466 target mRNA into a corresponding GAM337466 target protein.

The mechanism of the translational inhibition exerted by GAM337466 RNA, herein designated GAM RNA, on one or more GAM337466 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337466 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337466 RNA, herein designated GAM RNA, of GAM337466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337466 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337466 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337466 RNA correlate with, and may be deduced from, the identity of the GAM337466 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337469 6454 GAGGTCATAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGAATGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCATGTCAT genes whose function and utility is known in the art.

CAGAACAGGT GAM337469 is a novel bioinformatically detectable regulatory, non protein
GTGCCAGCCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337469 was detected
CCTGCATGGA is described with additional reference to Figs. 9-15.

ACATGTACAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTTC encoded by the human genome.

GAM337469 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337469 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337469 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337469 precursor RNA is designated SEQ ID:6454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6454 is located from position 118785414 to position 118785498 relative to chromosome 8 on the `-` strand.

GAM337469 precursor RNA folds onto itself, forming GAM337469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337469 precursor RNA, designated SEQ ID NO: 6454, and a schematic representation of a predicted secondary folding of GAM337469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337469 folded precursor RNA yielding a GAM337469 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337469 RNA, hereby incorporated herein.

GAM337469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337469 target RNA, herein designated GAM TARGET RNA.

GAM337469 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337469 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337469 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337469 RNA, herein designated GAM RNA, to target binding sites on GAM337469 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337469 target RNA into GAM337469 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337469 target genes. The mRNA of each one of this plurality of GAM337469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337469 RNA, herein designated GAM RNA, and which when bound by GAM337469 RNA causes inhibition of translation of the GAM337469 target mRNA into a corresponding GAM337469 target protein.

The mechanism of the translational inhibition exerted by GAM337469 RNA, herein designated GAM RNA, on one or more GAM337469 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337469 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337469 RNA, herein designated GAM RNA, of GAM337469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337469 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337469 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337469 RNA correlate with, and may be deduced from, the identity of the GAM337469 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGCTCCCCAG encoded by the human genome.

CTAGACTGAA GAM337470 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCTTTATGAG GAM337470 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GATTTTATTC GAM337470 precursor RNA does not encode a protein. A nucleotide sequence identical or

ATTTCAAG highly similar to the nucleotide sequence of GAM337470 precursor RNA is designated SEQ

ID:6197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6197 is located from position 119479486 to position 119479613 relative to chromosome 12 on the `-` strand.

GAM337470 precursor RNA folds onto itself, forming GAM337470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337470 precursor RNA, designated SEQ ID NO: 6197, and a schematic representation of a predicted secondary folding of GAM337470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337470 folded precursor RNA yielding a GAM337470 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337470 RNA, hereby incorporated herein.

GAM337470 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337470 target RNA, herein designated GAM TARGET RNA.

GAM337470 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337470 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337470 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337470 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337470 RNA, herein designated GAM RNA, to target binding sites on GAM337470 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337470 target RNA into GAM337470 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337470 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337470 target genes. The mRNA of each one of this plurality of GAM337470 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337470 RNA, herein designated GAM RNA, and which when bound by GAM337470 RNA causes inhibition of translation of the GAM337470 target mRNA into a corresponding GAM337470 target protein.

The mechanism of the translational inhibition exerted by GAM337470 RNA, herein designated GAM RNA, on one or more GAM337470 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337470 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337470 RNA, herein designated GAM RNA, of GAM337470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337470 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337470 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337470 RNA correlate with, and may be deduced from, the identity of the GAM337470 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337472 6289 GAACTGGGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTTATCAAA detected oligonucleotides of the present invention, referred to here as Genomic Address

CTCTGTGTTT Messenger 337472 (GAM337472) oligonucleotides modulates expression of respective target

ATGTGGCCTT genes whose function and utility is known in the art.

TAGAATATTA GAM337472 is a novel bioinformatically detectable regulatory, non protein

TCCCTCAGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337472 was detected

AGTTAGAGGC is described with additional reference to Figs. 9-15.

ACAGATTAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGAGTTTGAA encoded by the human genome.

GGTTGTCACT GAM337472 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGGTTT GAM337472 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337472 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337472 precursor RNA is designated SEQ ID:6289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6289 is located from position 120043180 to position 120043285 relative to chromosome 12 on the `-` strand.

GAM337472 precursor RNA folds onto itself, forming GAM337472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337472 precursor RNA, designated SEQ ID NO: 6289, and a schematic representation of a predicted secondary folding of GAM337472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337472 folded precursor RNA yielding a GAM337472 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337472 RNA, hereby incorporated herein.

GAM337472 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337472 target RNA, herein designated GAM TARGET RNA.

GAM337472 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337472 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337472 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337472 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337472 RNA, herein designated GAM RNA, to target binding sites on GAM337472 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337472 target RNA into GAM337472 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337472 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337472 target genes. The mRNA of each one of this plurality of GAM337472 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM337472 RNA, herein designated GAM RNA, and which when bound by GAM337472 RNA causes inhibition of translation of the GAM337472 target mRNA into a corresponding GAM337472 target protein.

The mechanism of the translational inhibition exerted by GAM337472 RNA, herein designated GAM RNA, on one or more GAM337472 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337472 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337472 RNA, herein designated GAM RNA, of GAM337472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337472 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337472 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337472 RNA correlate with, and may be deduced from, the identity of the GAM337472 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337473 5921 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337473 (GAM337473) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337473 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337473 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337473 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337473 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337473 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337473 precursor RNA is designated SEQ ID:5921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5921 is located from position 120076221 to position 120076302 relative to chromosome 6 on the `+` strand.

GAM337473 precursor RNA folds onto itself, forming GAM337473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337473 precursor RNA, designated SEQ ID NO: 5921, and a schematic representation of a predicted secondary folding of GAM337473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337473 folded precursor RNA yielding a GAM337473 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337473 RNA, hereby incorporated herein.

GAM337473 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337473 target RNA, herein designated GAM TARGET RNA.

GAM337473 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337473 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337473 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337473 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337473 RNA, herein designated GAM RNA, to target binding sites on GAM337473 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337473 target RNA

into GAM337473 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337473 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337473 target genes. The mRNA of each one of this plurality of GAM337473 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337473 RNA, herein designated GAM RNA, and which when bound by GAM337473 RNA causes inhibition of translation of the GAM337473 target mRNA into a corresponding GAM337473 target protein.

The mechanism of the translational inhibition exerted by GAM337473 RNA, herein designated GAM RNA, on one or more GAM337473 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337473 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337473 RNA, herein designated GAM RNA, of GAM337473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337473 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337473 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337473 RNA correlate with, and may be deduced from, the identity of the GAM337473 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337476 7137 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAGGAG Messenger 337476 (GAM337476) oligonucleotides modulates expression of respective target

GCGGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCGA GAM337476 is a novel bioinformatically detectable regulatory, non protein

AGATCGTGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337476 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGCAA encoded by the human genome.

AACTCTGTCT GAM337476 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM337476 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337476 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337476 precursor RNA is designated SEQ ID:7137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7137 is located from position 120997503 to position 120997604 relative to chromosome X on the `+` strand.

GAM337476 precursor RNA folds onto itself, forming GAM337476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337476 precursor RNA, designated SEQ ID NO: 7137, and a schematic representation of a predicted secondary folding of GAM337476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337476 folded precursor RNA yielding a GAM337476 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337476 RNA, hereby incorporated herein. Expression of GAM337476 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337476 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337476 target RNA, herein designated GAM TARGET RNA.

GAM337476 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337476 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337476 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337476 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337476 RNA, herein designated GAM RNA, to target binding sites on GAM337476 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337476 target RNA into GAM337476 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337476 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337476 target genes. The mRNA of each one of this plurality of GAM337476 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337476 RNA, herein designated GAM RNA, and which when bound by GAM337476 RNA causes inhibition of translation of the GAM337476 target mRNA into a corresponding GAM337476 target protein.

The mechanism of the translational inhibition exerted by GAM337476 RNA, herein designated GAM RNA, on one or more GAM337476 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337476 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337476 RNA, herein designated GAM RNA, of GAM337476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337476 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337476 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337476 RNA correlate with, and may be deduced from, the identity of the GAM337476 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337477 5922 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337477 (GAM337477) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337477 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337477 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337477 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337477 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337477 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337477 precursor RNA is designated SEQ ID:5922, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5922 is located from position 121175114 to position 121175195 relative to chromosome 9 on the `-` strand.

GAM337477 precursor RNA folds onto itself, forming GAM337477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337477 precursor RNA, designated SEQ ID NO: 5922, and a schematic representation of a predicted secondary folding of GAM337477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337477 folded precursor RNA yielding a GAM337477 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337477 RNA, hereby incorporated herein.

GAM337477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337477 target RNA, herein designated GAM TARGET RNA.

GAM337477 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337477 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337477 RNA, herein designated GAM RNA, to target binding sites on GAM337477 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337477 target RNA into GAM337477 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337477 target genes. The mRNA of each one of this plurality of GAM337477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337477 RNA, herein designated GAM RNA, and which when bound by GAM337477 RNA causes inhibition of translation of the GAM337477 target mRNA into a corresponding GAM337477 target protein.

The mechanism of the translational inhibition exerted by GAM337477 RNA, herein designated GAM RNA, on one or more GAM337477 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337477 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337477 RNA, herein designated GAM RNA, of GAM337477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337477 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337477 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337477

RNA correlate with, and may be deduced from, the identity of the GAM337477 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337478 5673 AATCAAAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GTTTGAGCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGGATGAACA Messenger 337478 (GAM337478) oligonucleotides modulates expression of respective target
CAATCTACAG genes whose function and utility is known in the art.

TCAGATTATG GAM337478 is a novel bioinformatically detectable regulatory, non protein
TCACTCCTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337478 was detected
GCCCAGACCT is described with additional reference to Figs. 9-15.

TCTTGATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337478 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337478 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337478 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337478 precursor RNA is designated SEQ ID:5673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5673 is located from position 121180039 to position 121180116 relative to chromosome 8 on the `+` strand.

GAM337478 precursor RNA folds onto itself, forming GAM337478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337478 precursor RNA, designated SEQ ID NO: 5673, and a schematic representation of a predicted secondary folding of GAM337478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337478 folded precursor RNA yielding a GAM337478 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337478 RNA, hereby incorporated herein.

GAM337478 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337478 target RNA, herein designated GAM TARGET RNA.

GAM337478 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337478 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337478 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337478 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337478 RNA, herein designated GAM RNA, to target binding sites on GAM337478 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337478 target RNA into GAM337478 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337478 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337478 target genes. The mRNA of each one of this plurality of GAM337478 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337478 RNA, herein designated GAM RNA, and which when bound by GAM337478 RNA causes inhibition of translation of the GAM337478 target mRNA into a corresponding GAM337478 target protein.

The mechanism of the translational inhibition exerted by GAM337478 RNA, herein designated GAM RNA, on one or more GAM337478 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337478 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337478 RNA, herein designated GAM RNA, of GAM337478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337478 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337478 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337478 RNA correlate with, and may be deduced from, the identity of the GAM337478 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337479 6198 CTGAGCAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAATCTCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GATCCCAGGA Messenger 337479 (GAM337479) oligonucleotides modulates expression of respective target
GGTCAAGGCT genes whose function and utility is known in the art.

GCAGTGAGCC GAM337479 is a novel bioinformatically detectable regulatory, non protein
ACAATTTTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337479 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAGAGCAA encoded by the human genome.

GACCCTGTCT GAM337479 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CAG GAM337479 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337479 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337479 precursor RNA is designated SEQ ID:6198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6198 is located from position 121585232 to position 121585334 relative to chromosome 12 on the `+` strand.

GAM337479 precursor RNA folds onto itself, forming GAM337479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337479 precursor RNA, designated SEQ ID NO: 6198, and a schematic representation of a predicted secondary folding of GAM337479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337479 folded precursor RNA yielding a GAM337479 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337479 RNA, hereby incorporated herein. Expression of GAM337479 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337479 target RNA, herein designated GAM TARGET RNA.

GAM337479 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337479 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337479 RNA, herein designated GAM RNA, to target binding sites on GAM337479 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337479 target RNA into GAM337479 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337479 target genes. The mRNA of each one of this plurality of GAM337479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337479 RNA, herein designated GAM RNA, and which when bound by GAM337479 RNA causes inhibition of translation of the GAM337479 target mRNA into a corresponding GAM337479 target protein.

The mechanism of the translational inhibition exerted by GAM337479 RNA, herein designated GAM RNA, on one or more GAM337479 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337479 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337479 RNA, herein designated GAM RNA, of GAM337479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337479 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337479 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337479 RNA correlate with, and may be deduced from, the identity of the GAM337479 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337480 5923 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337480 (GAM337480) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337480 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337480 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337480 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337480 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337480 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337480 precursor RNA is designated SEQ ID:5923, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5923 is located from position 121875870 to position 121875951 relative to chromosome 10 on the `+` strand.

GAM337480 precursor RNA folds onto itself, forming GAM337480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337480 precursor RNA, designated SEQ ID NO: 5923, and a schematic representation of a predicted secondary folding of GAM337480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337480 folded precursor RNA yielding a GAM337480 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337480 RNA, hereby incorporated herein.

GAM337480 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337480 target RNA, herein designated GAM TARGET RNA.

GAM337480 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337480 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337480 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337480 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337480 RNA, herein designated GAM RNA, to target binding sites on GAM337480 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337480 target RNA into GAM337480 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337480 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337480 target genes. The mRNA of each one of this plurality of GAM337480 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337480 RNA, herein designated GAM RNA, and which when bound by GAM337480 RNA causes inhibition of translation of the GAM337480 target mRNA into a corresponding GAM337480 target protein.

The mechanism of the translational inhibition exerted by GAM337480 RNA, herein designated GAM RNA, on one or more GAM337480 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337480 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337480 RNA, herein designated GAM RNA, of GAM337480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337480 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337480 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337480 RNA correlate with, and may be deduced from, the identity of the GAM337480 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337481 5644 AAAAATGAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAAAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGAGGCAGA Messenger 337481 (GAM337481) oligonucleotides modulates expression of respective target

TGGGAAGATG genes whose function and utility is known in the art.

ACCCTTTTAC GAM337481 is a novel bioinformatically detectable regulatory, non protein

AAATGTTTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337481 was detected

TCTCCTTTTT is described with additional reference to Figs. 9-15.

CTTTCTGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TT encoded by the human genome.

GAM337481 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337481 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337481 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337481 precursor RNA is designated SEQ

ID:5644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5644 is located from position 122005663 to position 122005744 relative to chromosome 11 on the `+` strand.

GAM337481 precursor RNA folds onto itself, forming GAM337481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337481 precursor RNA, designated SEQ ID NO: 5644, and a schematic representation of a predicted secondary folding of GAM337481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337481 folded precursor RNA yielding a GAM337481 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337481 RNA, hereby incorporated herein.

GAM337481 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337481 target RNA, herein designated GAM TARGET RNA.

GAM337481 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337481 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337481 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337481 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337481 RNA, herein designated GAM RNA, to target binding sites on GAM337481 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337481 target RNA into GAM337481 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337481 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337481 target genes. The mRNA of each one of this plurality of GAM337481 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337481 RNA, herein designated GAM RNA, and which when bound by GAM337481 RNA causes inhibition of translation of the GAM337481 target mRNA into a corresponding GAM337481 target protein.

The mechanism of the translational inhibition exerted by GAM337481 RNA, herein designated GAM RNA, on one or more GAM337481 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337481 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337481 RNA, herein designated GAM RNA, of GAM337481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337481 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337481 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337481 RNA correlate with, and may be deduced from, the identity of the GAM337481 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGGGCGGACG Messenger 337482 (GAM337482) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATCGC GAM337482 is a novel bioinformatically detectable regulatory, non protein

ACCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337482 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAATCTCC encoded by the human genome.

GAM337482 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337482 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337482 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337482 precursor RNA is designated SEQ ID:6657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6657 is located from position 122221602 to position 122221690 relative to chromosome 4 on the `+` strand.

GAM337482 precursor RNA folds onto itself, forming GAM337482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337482 precursor RNA, designated SEQ ID NO: 6657, and a schematic representation of a predicted secondary folding of GAM337482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337482 folded precursor RNA yielding a GAM337482 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337482 RNA, hereby incorporated herein. Expression of GAM337482 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337482 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337482 target RNA, herein designated GAM TARGET RNA.

GAM337482 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337482 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337482 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337482 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337482 RNA, herein designated GAM RNA, to target binding sites on GAM337482 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337482 target RNA into GAM337482 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337482 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337482 target genes. The mRNA of each one of this plurality of GAM337482 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337482 RNA, herein designated GAM RNA, and which when bound by GAM337482 RNA causes inhibition of translation of the GAM337482 target mRNA into a corresponding GAM337482 target protein.

The mechanism of the translational inhibition exerted by GAM337482 RNA, herein designated GAM RNA, on one or more GAM337482 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337482 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337482 RNA, herein designated GAM RNA, of GAM337482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337482 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337482 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337482 RNA correlate with, and may be deduced from, the identity of the GAM337482 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337485 7071 TCTGAGTCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGGCTGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAGGCTGCCC Messenger 337485 (GAM337485) oligonucleotides modulates expression of respective target

ACCTTTCATC genes whose function and utility is known in the art.

TAGGTGGGCA GAM337485 is a novel bioinformatically detectable regulatory, non protein
CAACGTAATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337485 was
detected
AGCTGCCAGC is described with additional reference to Figs. 9-15.

TTGACCAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
encoded by the human genome.

GAM337485 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337485 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA
genes
GAM337485 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337485 precursor RNA is designated SEQ ID:7071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7071 is located from position 122598663 to position 122598741 relative to chromosome 12 on the `+` strand.

GAM337485 precursor RNA folds onto itself, forming GAM337485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337485 precursor RNA, designated SEQ ID NO: 7071, and a schematic representation of a predicted secondary folding of GAM337485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337485 folded precursor RNA yielding a GAM337485 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337485 RNA, hereby incorporated herein.

GAM337485 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337485 target RNA, herein designated GAM TARGET RNA.

GAM337485 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337485 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337485 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337485 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337485 RNA, herein designated GAM RNA, to target binding sites on GAM337485 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337485 target RNA into GAM337485 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337485 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337485 target genes. The mRNA of each one of this plurality of GAM337485 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337485 RNA, herein designated GAM RNA, and which when bound by GAM337485 RNA causes inhibition of translation of the GAM337485 target mRNA into a corresponding GAM337485 target protein.

The mechanism of the translational inhibition exerted by GAM337485 RNA, herein designated GAM RNA, on one or more GAM337485 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337485 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337485 RNA, herein designated GAM RNA, of GAM337485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337485 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337485 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337485 RNA correlate with, and may be deduced from, the identity of the GAM337485 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337486 7106 TGAGATTTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGGCACTGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TTCTAAGTAG Messenger 337486 (GAM337486) oligonucleotides modulates expression of respective target
GAATCACACT genes whose function and utility is known in the art.

GCAGTGGGTT GAM337486 is a novel bioinformatically detectable regulatory, non protein
AGTGACACCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337486 was detected
TGCTCAGAAA is described with additional reference to Figs. 9-15.

TGGTGCCTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAAAATGTT encoded by the human genome.

TCA GAM337486 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337486 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337486 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337486 precursor RNA is designated SEQ ID:7106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7106 is located from position 122851359 to position 122851451 relative to chromosome 8 on the `-` strand.

GAM337486 precursor RNA folds onto itself, forming GAM337486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337486 precursor RNA, designated SEQ ID NO: 7106, and a schematic representation of a predicted secondary folding of GAM337486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337486 folded precursor RNA yielding a GAM337486 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337486 RNA, hereby incorporated herein.

GAM337486 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337486 target RNA, herein designated GAM TARGET RNA.

GAM337486 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337486 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337486 RNA, herein designated GAM RNA, to target binding sites on GAM337486 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337486 target RNA into GAM337486 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337486 target genes. The mRNA of each one of this plurality of GAM337486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337486 RNA, herein designated GAM RNA, and which when bound by GAM337486 RNA causes inhibition of translation of the GAM337486 target mRNA into a corresponding GAM337486 target protein.

The mechanism of the translational inhibition exerted by GAM337486 RNA, herein designated GAM RNA, on one or more GAM337486 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337486 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337486 RNA, herein designated GAM RNA, of GAM337486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337486 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337486 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337486 RNA correlate with, and may be deduced from, the identity of the GAM337486 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337488 5692 ACATTATTAG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATTTCAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGCTGGGCAT Messenger 337488 (GAM337488) oligonucleotides modulates expression of respective target
GTTGGAGTAT genes whose function and utility is known in the art.

GCCTGTGATC GAM337488 is a novel bioinformatically detectable regulatory, non protein
TCAGTTACTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337488 was detected
AGGAGGCTGA is described with additional reference to Figs. 9-15.

GGCAGAAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTACTTGAGG encoded by the human genome.

CCAGGAGTTT GAM337488 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAGTCTGTAG GAM337488 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TGT GAM337488 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337488 precursor RNA is designated SEQ ID:5692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5692 is located from position 123179192 to position 123179304 relative to chromosome 7 on the `+` strand.

GAM337488 precursor RNA folds onto itself, forming GAM337488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337488 precursor RNA, designated SEQ ID NO: 5692, and a schematic representation of a predicted secondary folding of GAM337488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337488 folded precursor RNA yielding a GAM337488 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337488 RNA, hereby incorporated herein.

GAM337488 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337488 target RNA, herein designated GAM TARGET RNA.

GAM337488 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337488 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337488 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337488 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337488 RNA, herein designated GAM RNA, to target binding sites on GAM337488 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337488 target RNA into GAM337488 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337488 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337488 target genes. The mRNA of each one of this plurality of GAM337488 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337488 RNA, herein designated GAM RNA, and which when bound by GAM337488 RNA causes inhibition of translation of the GAM337488 target mRNA into a corresponding GAM337488 target protein.

The mechanism of the translational inhibition exerted by GAM337488 RNA, herein designated GAM RNA, on one or more GAM337488 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337488 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337488 RNA, herein designated GAM RNA, of

GAM337488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337488 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337488 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337488 RNA correlate with, and may be deduced from, the identity of the GAM337488 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337489 7221 TGGAGGAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTGGTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTTAAATAC Messenger 337489 (GAM337489) oligonucleotides modulates expression of respective target

AACCTAAATC genes whose function and utility is known in the art.

AAACCACAGT GAM337489 is a novel bioinformatically detectable regulatory, non protein

TGACCAACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337489 was detected

CCACATCCAG is described with additional reference to Figs. 9-15.

CTTCTCCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CA encoded by the human genome.

GAM337489 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337489 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337489 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337489 precursor RNA is designated SEQ ID:7221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7221 is located from position 123330334 to position 123330415 relative to chromosome 11 on the `-` strand.

GAM337489 precursor RNA folds onto itself, forming GAM337489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337489 precursor RNA, designated SEQ ID NO: 7221, and

a schematic representation of a predicted secondary folding of GAM337489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337489 folded precursor RNA yielding a GAM337489 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337489 RNA, hereby incorporated herein.

GAM337489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337489 target RNA, herein designated GAM TARGET RNA.

GAM337489 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337489 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337489 RNA, herein designated GAM RNA, to target binding sites on GAM337489 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337489 target RNA into GAM337489 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337489 target genes. The mRNA of each one of this plurality of GAM337489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337489 RNA, herein designated GAM RNA, and which when bound by GAM337489 RNA causes inhibition of translation of the GAM337489 target mRNA into a corresponding GAM337489 target protein.

The mechanism of the translational inhibition exerted by GAM337489 RNA, herein designated GAM RNA, on one or more GAM337489 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337489 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337489 RNA, herein designated GAM RNA, of GAM337489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337489 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337489 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337489 RNA correlate with, and may be deduced from, the identity of the GAM337489 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337490 6337 GAGACAGGAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGCTTCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GACTGTGGAC Messenger 337490 (GAM337490) oligonucleotides modulates expression of respective target

TGGGCTGCTG genes whose function and utility is known in the art.

GCCTGCTTGC GAM337490 is a novel bioinformatically detectable regulatory, non protein

TTCCTCCCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337490 was detected

CCCCATTCCT is described with additional reference to Figs. 9-15.

AGCAGGGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGGCCCTCC encoded by the human genome.

TCTTCTC GAM337490 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337490 precursor RNA is designated SEQ ID:6337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6337 is located from position 123435499 to position 123435595 relative to chromosome 9 on the `+` strand.

GAM337490 precursor RNA folds onto itself, forming GAM337490 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337490 precursor RNA, designated SEQ ID NO: 6337, and a schematic representation of a predicted secondary folding of GAM337490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337490 folded precursor RNA yielding a GAM337490 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337490 RNA, hereby incorporated herein.

GAM337490 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337490 target RNA, herein designated GAM TARGET RNA.

GAM337490 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337490 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337490 RNA, herein designated GAM RNA, to target binding sites on GAM337490 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337490 target RNA into GAM337490 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337490 target genes. The mRNA of each one of this plurality of GAM337490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337490 RNA,

herein designated GAM RNA, and which when bound by GAM337490 RNA causes inhibition of translation of the GAM337490 target mRNA into a corresponding GAM337490 target protein.

The mechanism of the translational inhibition exerted by GAM337490 RNA, herein designated GAM RNA, on one or more GAM337490 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337490 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337490 RNA, herein designated GAM RNA, of GAM337490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337490 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337490 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337490 RNA correlate with, and may be deduced from, the identity of the GAM337490 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337495 6793 GGGAGGCCAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGGGAAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGCTTGAGC Messenger 337495 (GAM337495) oligonucleotides modulates expression of respective target

CCTGGAGGTT genes whose function and utility is known in the art.

GAGACAAGCC GAM337495 is a novel bioinformatically detectable regulatory, non protein

TGGGCAACAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337495 was detected

AGCAATACCC is described with additional reference to Figs. 9-15.

CATTTGTTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TT encoded by the human genome.

GAM337495 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337495 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337495 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337495 precursor RNA is designated SEQ ID:6793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6793 is located from position 123734213 to position 123734294 relative to chromosome 12 on the `-` strand.

GAM337495 precursor RNA folds onto itself, forming GAM337495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337495 precursor RNA, designated SEQ ID NO: 6793, and a schematic representation of a predicted secondary folding of GAM337495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337495 folded precursor RNA yielding a GAM337495 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337495 RNA, hereby incorporated herein.

GAM337495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337495 target RNA, herein designated GAM TARGET RNA.

GAM337495 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337495 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337495 RNA, herein designated GAM RNA, to target binding sites on GAM337495 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337495 target RNA

into GAM337495 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337495 target genes. The mRNA of each one of this plurality of GAM337495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337495 RNA, herein designated GAM RNA, and which when bound by GAM337495 RNA causes inhibition of translation of the GAM337495 target mRNA into a corresponding GAM337495 target protein.

The mechanism of the translational inhibition exerted by GAM337495 RNA, herein designated GAM RNA, on one or more GAM337495 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337495 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337495 RNA, herein designated GAM RNA, of GAM337495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337495 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337495 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337495 RNA correlate with, and may be deduced from, the identity of the GAM337495 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337496 6607 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGAAGG Messenger 337496 (GAM337496) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTAAGATCGC GAM337496 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337496 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACATTCT encoded by the human genome.

GAM337496 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337496 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337496 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337496 precursor RNA is designated SEQ ID:6607, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6607 is located from position 124130227 to position 124130314 relative to chromosome 12 on the `-` strand.

GAM337496 precursor RNA folds onto itself, forming GAM337496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337496 precursor RNA, designated SEQ ID NO: 6607, and a schematic representation of a predicted secondary folding of GAM337496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337496 folded precursor RNA yielding a GAM337496 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337496 RNA, hereby incorporated herein. Expression of GAM337496 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337496 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337496 target RNA, herein designated GAM TARGET RNA.

GAM337496 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337496 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337496 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337496 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337496 RNA, herein designated GAM RNA, to target binding sites on GAM337496 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337496 target RNA into GAM337496 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337496 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337496 target genes. The mRNA of each one of this plurality of GAM337496 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337496 RNA, herein designated GAM RNA, and which when bound by GAM337496 RNA causes inhibition of translation of the GAM337496 target mRNA into a corresponding GAM337496 target protein.

The mechanism of the translational inhibition exerted by GAM337496 RNA, herein designated GAM RNA, on one or more GAM337496 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337496 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337496 RNA, herein designated GAM RNA, of GAM337496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337496 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337496 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337496 RNA correlate with, and may be deduced from, the identity of the GAM337496 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337497 6199 CTGAGCTTAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATCTTATGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCTTTCTGG Messenger 337497 (GAM337497) oligonucleotides modulates expression of respective target
TCTGTGTATC genes whose function and utility is known in the art.

CCAGGACTGT GAM337497 is a novel bioinformatically detectable regulatory, non protein
TCATCTCCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337497 was detected
TGTGATGCTG is described with additional reference to Figs. 9-15.

AAGACCAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGTGACCAA encoded by the human genome.

GAAGGCTCAG GAM337497 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337497 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337497 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337497 precursor RNA is designated SEQ ID:6199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6199 is located from position 124151674 to position 124151773 relative to chromosome 9 on the `-` strand.

GAM337497 precursor RNA folds onto itself, forming GAM337497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337497 precursor RNA, designated SEQ ID NO: 6199, and a schematic representation of a predicted secondary folding of GAM337497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337497 folded precursor RNA yielding a GAM337497 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337497 RNA, hereby incorporated herein.

GAM337497 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337497 target RNA, herein designated GAM TARGET RNA.

GAM337497 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337497 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337497 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337497 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337497 RNA, herein designated GAM RNA, to target binding sites on GAM337497 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337497 target RNA into GAM337497 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337497 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337497 target genes. The mRNA of each one of this plurality of GAM337497 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337497 RNA, herein designated GAM RNA, and which when bound by GAM337497 RNA causes inhibition of translation of the GAM337497 target mRNA into a corresponding GAM337497 target protein.

The mechanism of the translational inhibition exerted by GAM337497 RNA, herein designated GAM RNA, on one or more GAM337497 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337497 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337497 RNA, herein designated GAM RNA, of GAM337497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337497 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337497 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337497

RNA correlate with, and may be deduced from, the identity of the GAM337497 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337498 6086 CCCTGAACTC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGGGCTTCG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCACTGATTG Messenger 337498 (GAM337498) oligonucleotides modulates expression of respective target
TCCAAACGCA genes whose function and utility is known in the art.

ATTCTTGTAC GAM337498 is a novel bioinformatically detectable regulatory, non protein
GAGTCTGCGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337498 was detected
CCAACCGAGA is described with additional reference to Figs. 9-15.

ATTGTGGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GACATCTGTG encoded by the human genome.

GCTGAGCTCC GAM337498 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GGGCGCAACA GAM337498 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GGG GAM337498 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337498 precursor RNA is designated SEQ ID:6086, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6086 is located from position 124608557 to position 124608669 relative to chromosome 9 on the `-` strand.

GAM337498 precursor RNA folds onto itself, forming GAM337498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337498 precursor RNA, designated SEQ ID NO: 6086, and a schematic representation of a predicted secondary folding of GAM337498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337498 folded precursor RNA yielding a GAM337498 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM337498 RNA, hereby incorporated herein.

GAM337498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337498 target RNA, herein designated GAM TARGET RNA.

GAM337498 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337498 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337498 RNA, herein designated GAM RNA, to target binding sites on GAM337498 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337498 target RNA into GAM337498 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337498 target genes. The mRNA of each one of this plurality of GAM337498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337498 RNA, herein designated GAM RNA, and which when bound by GAM337498 RNA causes inhibition of translation of the GAM337498 target mRNA into a corresponding GAM337498 target protein.

The mechanism of the translational inhibition exerted by GAM337498 RNA, herein designated GAM RNA, on one or more GAM337498 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337498 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337498 RNA, herein designated GAM RNA, of GAM337498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337498 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337498 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337498 RNA correlate with, and may be deduced from, the identity of the GAM337498 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCCACTGATT Messenger 337499 (GAM337499) oligonucleotides modulates expression of respective target
GTCCAAACGC genes whose function and utility is known in the art.

AATTCTTGTA GAM337499 is a novel bioinformatically detectable regulatory, non protein
CGAGTCTGCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337499 was detected
GCCAACCGAG is described with additional reference to Figs. 9-15.

AATTGTGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGACATCTGT encoded by the human genome.

GGCTGAGCTC GAM337499 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CGGGC GAM337499 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337499 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337499 precursor RNA is designated SEQ ID:6507, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6507 is located from position 124608566 to position 124608670 relative to chromosome 9 on the `-` strand.

GAM337499 precursor RNA folds onto itself, forming GAM337499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337499 precursor RNA, designated SEQ ID NO: 6507, and a schematic representation of a predicted secondary folding of GAM337499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337499 folded precursor RNA yielding a GAM337499 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337499 RNA, hereby incorporated herein.

GAM337499 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337499 target RNA, herein designated GAM TARGET RNA.

GAM337499 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337499 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337499 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337499 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337499 RNA, herein designated GAM RNA, to target binding sites on GAM337499 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337499 target RNA into GAM337499 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337499 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337499 target genes. The mRNA of each one of this plurality of GAM337499 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337499 RNA, herein designated GAM RNA, and which when bound by GAM337499 RNA causes inhibition of translation of the GAM337499 target mRNA into a corresponding GAM337499 target protein.

The mechanism of the translational inhibition exerted by GAM337499 RNA, herein designated GAM RNA, on one or more GAM337499 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337499 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337499 RNA, herein designated GAM RNA, of GAM337499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337499 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337499 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337499 RNA correlate with, and may be deduced from, the identity of the GAM337499 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAATTGTGG is described with additional reference to Figs. 9-15.

CTGGACATCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGGCTGAGC encoded by the human genome.

TCCGGG GAM337500 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337500 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337500 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337500 precursor RNA is designated SEQ ID:6161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6161 is located from position 124608567 to position 124608662 relative to chromosome 9 on the `-` strand.

GAM337500 precursor RNA folds onto itself, forming GAM337500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337500 precursor RNA, designated SEQ ID NO: 6161, and a schematic representation of a predicted secondary folding of GAM337500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337500 folded precursor RNA yielding a GAM337500 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337500 RNA, hereby incorporated herein.

GAM337500 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337500 target RNA, herein designated GAM TARGET RNA.

GAM337500 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337500 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337500 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337500 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337500 RNA, herein designated GAM RNA, to target binding sites on GAM337500 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337500 target RNA into GAM337500 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337500 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337500 target genes. The mRNA of each one of this plurality of GAM337500 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337500 RNA, herein designated GAM RNA, and which when bound by GAM337500 RNA causes inhibition of translation of the GAM337500 target mRNA into a corresponding GAM337500 target protein.

The mechanism of the translational inhibition exerted by GAM337500 RNA, herein designated GAM RNA, on one or more GAM337500 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337500 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337500 RNA, herein designated GAM RNA, of GAM337500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337500 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337500 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337500 RNA correlate with, and may be deduced from, the identity of the GAM337500 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337501 6813 GGGGCTTCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CACTGATTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAAACGCAA Messenger 337501 (GAM337501) oligonucleotides modulates expression of respective target

TTCTTGTACG genes whose function and utility is known in the art.

AGTCTGCGGC GAM337501 is a novel bioinformatically detectable regulatory, non protein

CAACCGAGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337501 was detected

TTGTGGCTGG is described with additional reference to Figs. 9-15.

ACATCTGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGAGCTCC encoded by the human genome.

GAM337501 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337501 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337501 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337501 precursor RNA is designated SEQ

ID:6813, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6813 is located from position 124608570 to position 124608658 relative to chromosome 9 on the `-` strand.

GAM337501 precursor RNA folds onto itself, forming GAM337501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337501 precursor RNA, designated SEQ ID NO: 6813, and a schematic representation of a predicted secondary folding of GAM337501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337501 folded precursor RNA yielding a GAM337501 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337501 RNA, hereby incorporated herein.

GAM337501 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337501 target RNA, herein designated GAM TARGET RNA.

GAM337501 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337501 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337501 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337501 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337501 RNA, herein designated GAM RNA, to target binding sites on GAM337501 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337501 target RNA into GAM337501 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337501 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337501 target genes. The mRNA of each one of this plurality of GAM337501 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337501 RNA, herein designated GAM RNA, and which when bound by GAM337501 RNA causes inhibition of translation of the GAM337501 target mRNA into a corresponding GAM337501 target protein.

The mechanism of the translational inhibition exerted by GAM337501 RNA, herein designated GAM RNA, on one or more GAM337501 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337501 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337501 RNA, herein designated GAM RNA, of GAM337501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337501 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337501 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337501 RNA correlate with, and may be deduced from, the identity of the GAM337501 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337502 5924 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337502 (GAM337502) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337502 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337502 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337502 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337502 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337502 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337502 precursor RNA is designated SEQ ID:5924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5924 is located from position 124663501 to position 124663582 relative to chromosome 6 on the `+` strand.

GAM337502 precursor RNA folds onto itself, forming GAM337502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337502 precursor RNA, designated SEQ ID NO: 5924, and a schematic representation of a predicted secondary folding of GAM337502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337502 folded precursor RNA yielding a GAM337502 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337502 RNA, hereby incorporated herein.

GAM337502 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337502 target RNA, herein designated GAM TARGET RNA.

GAM337502 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337502 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337502 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337502 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337502 RNA, herein designated GAM RNA, to target binding sites on GAM337502 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337502 target RNA into GAM337502 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337502 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337502 target genes. The mRNA of each one of this plurality of GAM337502 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337502 RNA, herein designated GAM RNA, and which when bound by GAM337502 RNA causes inhibition of translation of the GAM337502 target mRNA into a corresponding GAM337502 target protein.

The mechanism of the translational inhibition exerted by GAM337502 RNA, herein designated GAM RNA, on one or more GAM337502 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337502 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337502 RNA, herein designated GAM RNA, of GAM337502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337502 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337502 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337502 RNA correlate with, and may be deduced from, the identity of the GAM337502 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337507 6075 CCCAGTGACC Fig. 8 further provides a conceptual description of another novel bioinformatically

CACAGGTAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCTTGTGT Messenger 337507 (GAM337507) oligonucleotides modulates expression of respective target

TTTCCAGATT genes whose function and utility is known in the art.

CTGAGTGTGG GAM337507 is a novel bioinformatically detectable regulatory, non protein
CTCAGCTCGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337507 was detected
GAATGCAGTG is described with additional reference to Figs. 9-15.

GCACAAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTCTGTGGGA encoded by the human genome.

GTGGATCTTG GAM337507 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GG GAM337507 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337507 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337507 precursor RNA is designated SEQ ID:6075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6075 is located from position 126234545 to position 126234646 relative to chromosome 11 on the `+` strand.

GAM337507 precursor RNA folds onto itself, forming GAM337507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337507 precursor RNA, designated SEQ ID NO: 6075, and a schematic representation of a predicted secondary folding of GAM337507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337507 folded precursor RNA yielding a GAM337507 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337507 RNA, hereby incorporated herein.

GAM337507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337507 target RNA, herein designated GAM TARGET RNA.

GAM337507 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337507 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337507 RNA, herein designated GAM RNA, to target binding sites on GAM337507 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337507 target RNA into GAM337507 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337507 target genes. The mRNA of each one of this plurality of GAM337507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337507 RNA, herein designated GAM RNA, and which when bound by GAM337507 RNA causes inhibition of translation of the GAM337507 target mRNA into a corresponding GAM337507 target protein.

The mechanism of the translational inhibition exerted by GAM337507 RNA, herein designated GAM RNA, on one or more GAM337507 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337507 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337507 RNA, herein designated GAM RNA, of GAM337507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337507 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337507 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337507 RNA correlate with, and may be deduced from, the identity of the GAM337507 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337508 6068 CCCACAGGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTTTCCAGA Messenger 337508 (GAM337508) oligonucleotides modulates expression of respective target
TTCTGAGTGT genes whose function and utility is known in the art.

GGCTCAGCTC GAM337508 is a novel bioinformatically detectable regulatory, non protein
GTGAATGCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337508 was detected
TGGCACAAGG is described with additional reference to Figs. 9-15.

CACTCTGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
G encoded by the human genome.

GAM337508 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337508 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337508 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337508 precursor RNA is designated SEQ ID:6068, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6068 is located from position 126234553 to position 126234633 relative to chromosome 11 on the `+` strand.

GAM337508 precursor RNA folds onto itself, forming GAM337508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337508 precursor RNA, designated SEQ ID NO: 6068, and a schematic representation of a predicted secondary folding of GAM337508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337508 folded precursor RNA yielding a GAM337508 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337508 RNA, hereby incorporated herein.

GAM337508 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337508 target RNA, herein designated GAM TARGET RNA.

GAM337508 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337508 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337508 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337508 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337508 RNA, herein designated GAM RNA, to target binding sites on GAM337508 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337508 target RNA into GAM337508 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337508 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337508 target genes. The mRNA of each one of this plurality of GAM337508 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337508 RNA, herein designated GAM RNA, and which when bound by GAM337508 RNA causes inhibition of translation of the GAM337508 target mRNA into a corresponding GAM337508 target protein.

The mechanism of the translational inhibition exerted by GAM337508 RNA, herein designated GAM RNA, on one or more GAM337508 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337508 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337508 RNA, herein designated GAM RNA, of GAM337508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337508 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337508 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337508 RNA correlate with, and may be deduced from, the identity of the GAM337508 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATCGCATCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337510 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGCGAGA encoded by the human genome.

CTCTGTCTC GAM337510 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337510 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337510 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337510 precursor RNA is designated SEQ ID:6418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6418 is located from position 126518661 to position 126518759 relative to chromosome 12 on the `+` strand.

GAM337510 precursor RNA folds onto itself, forming GAM337510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337510 precursor RNA, designated SEQ ID NO: 6418, and a schematic representation of a predicted secondary folding of GAM337510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337510 folded precursor RNA yielding a GAM337510 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337510 RNA, hereby incorporated herein. Expression of GAM337510 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337510 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337510 target RNA, herein designated GAM TARGET RNA.

GAM337510 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337510 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337510 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337510 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337510 RNA, herein designated GAM RNA, to target binding sites on GAM337510 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337510 target RNA into GAM337510 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337510 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337510 target genes. The mRNA of each one of this plurality of GAM337510 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337510 RNA, herein designated GAM RNA, and which when bound by GAM337510 RNA causes inhibition of translation of the GAM337510 target mRNA into a corresponding GAM337510 target protein.

The mechanism of the translational inhibition exerted by GAM337510 RNA, herein designated GAM RNA, on one or more GAM337510 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337510 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337510 RNA, herein designated GAM RNA, of GAM337510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337510 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337510 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337510 RNA correlate with, and may be deduced from, the identity of the GAM337510 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337511 6029 CAGGTGTGCG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCACCACACG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGACTGGGAA Messenger 337511 (GAM337511) oligonucleotides modulates expression of respective target

GCCTTCTGGT genes whose function and utility is known in the art.

TTTAAGATGG GAM337511 is a novel bioinformatically detectable regulatory, non protein

CTTTAGAATG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337511 was detected

AAAGGCAGTT is described with additional reference to Figs. 9-15.

CCTAGCACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGGTCAATC encoded by the human genome.

ACATCTG GAM337511 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337511 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337511 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337511 precursor RNA is designated SEQ ID:6029, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6029 is located from position 126721975 to position 126722071 relative to chromosome 10 on the `+` strand.

GAM337511 precursor RNA folds onto itself, forming GAM337511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337511 precursor RNA, designated SEQ ID NO: 6029, and a schematic representation of a predicted secondary folding of GAM337511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337511 folded precursor RNA yielding a GAM337511 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337511 RNA, hereby incorporated herein.

GAM337511 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337511 target RNA, herein designated GAM TARGET RNA.

GAM337511 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337511 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337511 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337511 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337511 RNA, herein designated GAM RNA, to target binding sites on GAM337511 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337511 target RNA into GAM337511 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337511 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337511 target genes. The mRNA of each one of this plurality of GAM337511 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337511 RNA, herein designated GAM RNA, and which when bound by GAM337511 RNA causes inhibition of translation of the GAM337511 target mRNA into a corresponding GAM337511 target protein.

The mechanism of the translational inhibition exerted by GAM337511 RNA, herein designated GAM RNA, on one or more GAM337511 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337511 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337511 RNA, herein designated GAM RNA, of GAM337511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337511 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337511 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337511 RNA correlate with, and may be deduced from, the identity of the GAM337511 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337512 6578 GGAACGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGGAGGCA Messenger 337512 (GAM337512) oligonucleotides modulates expression of respective target

AAGGTTGCAG genes whose function and utility is known in the art.

TGAGTCAAGA GAM337512 is a novel bioinformatically detectable regulatory, non protein

TCATGCCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337512 was detected

GCACTCCTGC is described with additional reference to Figs. 9-15.

CTGGGTGACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGTGAGACC encoded by the human genome.

TTGTCTC GAM337512 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337512 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337512 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337512 precursor RNA is designated SEQ ID:6578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6578 is located from position 126808650 to position 126808746

relative to chromosome 10 on the `+` strand.

GAM337512 precursor RNA folds onto itself, forming GAM337512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337512 precursor RNA, designated SEQ ID NO: 6578, and a schematic representation of a predicted secondary folding of GAM337512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337512 folded precursor RNA yielding a GAM337512 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337512 RNA, hereby incorporated herein.

GAM337512 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337512 target RNA, herein designated GAM TARGET RNA.

GAM337512 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337512 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337512 RNA, herein designated GAM RNA, to target binding sites on GAM337512 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337512 target RNA into GAM337512 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337512 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337512 target genes. The mRNA of each one of this plurality of GAM337512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337512 RNA, herein designated GAM RNA, and which when bound by GAM337512 RNA causes inhibition of translation of the GAM337512 target mRNA into a corresponding GAM337512 target protein.

The mechanism of the translational inhibition exerted by GAM337512 RNA, herein designated GAM RNA, on one or more GAM337512 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337512 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337512 RNA, herein designated GAM RNA, of GAM337512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337512 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337512 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337512 RNA correlate with, and may be deduced from, the identity of the GAM337512 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337515 6120 CCTGCTGTAT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTAGGCATT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGCAAGGTG Messenger 337515 (GAM337515) oligonucleotides modulates expression of respective target

TTAGGGCTGA genes whose function and utility is known in the art.

TGCTTGAGCA GAM337515 is a novel bioinformatically detectable regulatory, non protein

CAGTACCTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337515 was detected

ACATCTGCAG is described with additional reference to Figs. 9-15.

TATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337515 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337515 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337515 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337515 precursor RNA is designated SEQ ID:6120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6120 is located from position 127715522 to position 127715596 relative to chromosome 7 on the `+` strand.

GAM337515 precursor RNA folds onto itself, forming GAM337515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337515 precursor RNA, designated SEQ ID NO: 6120, and a schematic representation of a predicted secondary folding of GAM337515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337515 folded precursor RNA yielding a GAM337515 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337515 RNA, hereby incorporated herein.

GAM337515 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337515 target RNA, herein designated GAM TARGET RNA.

GAM337515 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337515 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337515 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337515 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337515 RNA, herein designated GAM RNA, to target

binding sites on GAM337515 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337515 target RNA into GAM337515 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337515 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337515 target genes. The mRNA of each one of this plurality of GAM337515 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337515 RNA, herein designated GAM RNA, and which when bound by GAM337515 RNA causes inhibition of translation of the GAM337515 target mRNA into a corresponding GAM337515 target protein.

The mechanism of the translational inhibition exerted by GAM337515 RNA, herein designated GAM RNA, on one or more GAM337515 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337515 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337515 RNA, herein designated GAM RNA, of GAM337515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337515 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337515 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337515 RNA correlate with, and may be deduced from, the identity of the GAM337515 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337516 6143 CGCTTGCAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAAAGGCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTTGCAGT Messenger 337516 (GAM337516) oligonucleotides modulates expression of respective target

GAACCAAGAT genes whose function and utility is known in the art.

CGCACCACTG GAM337516 is a novel bioinformatically detectable regulatory, non protein

CACTCCAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337516 was detected

TGGGCAACAA is described with additional reference to Figs. 9-15.

AAGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337516 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337516 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337516 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337516 precursor RNA is designated SEQ ID:6143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6143 is located from position 127763749 to position 127763823 relative to chromosome 7 on the `-` strand.

GAM337516 precursor RNA folds onto itself, forming GAM337516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337516 precursor RNA, designated SEQ ID NO: 6143, and a schematic representation of a predicted secondary folding of GAM337516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337516 folded precursor RNA yielding a GAM337516 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337516 RNA, hereby incorporated herein. Expression of GAM337516 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337516 target RNA, herein designated GAM TARGET RNA.

GAM337516 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337516 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337516 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337516 RNA, herein designated GAM RNA, to target binding sites on GAM337516 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337516 target RNA into GAM337516 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337516 target genes. The mRNA of each one of this plurality of GAM337516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337516 RNA, herein designated GAM RNA, and which when bound by GAM337516 RNA causes inhibition of translation of the GAM337516 target mRNA into a corresponding GAM337516 target protein.

The mechanism of the translational inhibition exerted by GAM337516 RNA, herein designated GAM RNA, on one or more GAM337516 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337516 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337516 RNA, herein designated GAM RNA, of GAM337516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337516 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337516 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337516 RNA correlate with, and may be deduced from, the identity of the GAM337516 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCAGGGTGT is described with additional reference to Figs. 9-15.

GGGAGCACGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGGAGGT encoded by the human genome.

AAGAGTTTAA GAM337518 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

ACTGTG GAM337518 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337518 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337518 precursor RNA is designated SEQ ID:6001, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6001 is located from position 127854074 to position 127854179 relative to chromosome 10 on the `+` strand.

GAM337518 precursor RNA folds onto itself, forming GAM337518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337518 precursor RNA, designated SEQ ID NO: 6001, and a schematic representation of a predicted secondary folding of GAM337518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337518 folded precursor RNA yielding a GAM337518 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337518 RNA, hereby incorporated herein.

GAM337518 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337518 target RNA, herein designated GAM TARGET RNA.

GAM337518 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337518 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337518 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337518 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337518 RNA, herein designated GAM RNA, to target binding sites on GAM337518 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337518 target RNA into GAM337518 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337518 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337518 target genes. The mRNA of each one of this plurality of GAM337518 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337518 RNA, herein designated GAM RNA, and which when bound by GAM337518 RNA causes inhibition of translation of the GAM337518 target mRNA into a corresponding GAM337518 target protein.

The mechanism of the translational inhibition exerted by GAM337518 RNA, herein designated GAM RNA, on one or more GAM337518 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337518 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337518 RNA, herein designated GAM RNA, of GAM337518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337518 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337518 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337518 RNA correlate with, and may be deduced from, the identity of the GAM337518 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337520 6093 CCCTTATGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
ATTCTGGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGGTGGCTAC Messenger 337520 (GAM337520) oligonucleotides modulates expression of respective target
ACGGATGTAC genes whose function and utility is known in the art.

ATGAGTGTGA GAM337520 is a novel bioinformatically detectable regulatory, non protein
AAAAATCATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337520 was detected
AAACTGTATG is described with additional reference to Figs. 9-15.

CTCTGTGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTTACTGTAT encoded by the human genome.

CTGTTATCCT GAM337520 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCCTAATGGG GAM337520 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337520 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337520 precursor RNA is designated SEQ ID:6093, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6093 is located from position 128242511 to position 128242620 relative to chromosome 9 on the `+` strand.

GAM337520 precursor RNA folds onto itself, forming GAM337520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337520 precursor RNA, designated SEQ ID NO: 6093, and a schematic representation of a predicted secondary folding of GAM337520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337520 folded precursor RNA yielding a GAM337520 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337520 RNA, hereby incorporated herein.

GAM337520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337520 target RNA, herein designated GAM TARGET RNA.

GAM337520 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337520 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337520 RNA, herein designated GAM RNA, to target binding sites on GAM337520 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337520 target RNA into GAM337520 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337520 target genes. The mRNA of each one of this plurality of GAM337520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337520 RNA, herein designated GAM RNA, and which when bound by GAM337520 RNA causes inhibition of translation of the GAM337520 target mRNA into a corresponding GAM337520 target protein.

The mechanism of the translational inhibition exerted by GAM337520 RNA, herein designated GAM RNA, on one or more GAM337520 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337520 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337520 RNA, herein designated GAM RNA, of GAM337520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337520 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337520 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337520 RNA correlate with, and may be deduced from, the identity of the GAM337520 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337521 6011 CAGACCCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTCTTTCCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GGCTTCCTGT Messenger 337521 (GAM337521) oligonucleotides modulates expression of respective target
CCTTCAGCAA genes whose function and utility is known in the art.

GGCCACCTGA GAM337521 is a novel bioinformatically detectable regulatory, non protein
GAACTGAATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337521 was detected
GTAAATTCCA is described with additional reference to Figs. 9-15.

GCCTTGCAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAGGGGAGG encoded by the human genome.

AGGCTGAAAG GAM337521 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ACAAGATAAA GAM337521 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TG GAM337521 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337521 precursor RNA is designated SEQ ID:6011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6011 is located from position 128399235 to position 128399346 relative to chromosome 9 on the `+` strand.

GAM337521 precursor RNA folds onto itself, forming GAM337521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337521 precursor RNA, designated SEQ ID NO: 6011, and a schematic representation of a predicted secondary folding of GAM337521 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337521 folded precursor RNA yielding a GAM337521 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337521 RNA, hereby incorporated herein.

GAM337521 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337521 target RNA, herein designated GAM TARGET RNA.

GAM337521 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337521 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337521 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337521 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337521 RNA, herein designated GAM RNA, to target binding sites on GAM337521 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337521 target RNA into GAM337521 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337521 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337521 target genes. The mRNA of each one of this plurality of GAM337521 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337521 RNA, herein designated GAM RNA, and which when bound by GAM337521 RNA causes inhibition of translation of the GAM337521 target mRNA into a corresponding GAM337521 target protein.

The mechanism of the translational inhibition exerted by GAM337521 RNA, herein designated GAM RNA, on one or more GAM337521 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337521 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337521 RNA, herein designated GAM RNA, of GAM337521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337521 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337521 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337521 RNA correlate with, and may be deduced from, the identity of the GAM337521 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337522 7066 TCTCTCTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGGCTTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTCCTTCAG Messenger 337522 (GAM337522) oligonucleotides modulates expression of respective target
CAAGGCCACC genes whose function and utility is known in the art.

TGAGAACTGA GAM337522 is a novel bioinformatically detectable regulatory, non protein
ATTGTAAATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337522 was detected
CCAGCCTTGC is described with additional reference to Figs. 9-15.

AAGGAAGGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGAGGCTGA encoded by the human genome.

AAGACAAGA GAM337522 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337522 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337522 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337522 precursor RNA is designated SEQ ID:7066, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7066 is located from position 128399242 to position 128399340 relative to chromosome 9 on the `+` strand.

GAM337522 precursor RNA folds onto itself, forming GAM337522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337522 precursor RNA, designated SEQ ID NO: 7066, and a schematic representation of a predicted secondary folding of GAM337522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337522 folded precursor RNA yielding a GAM337522 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337522 RNA, hereby incorporated herein.

GAM337522 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337522 target RNA, herein designated GAM TARGET RNA.

GAM337522 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337522 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337522 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337522 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337522 RNA, herein designated GAM RNA, to target binding sites on GAM337522 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337522 target RNA into GAM337522 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337522 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337522 target genes. The mRNA of each one of this plurality of GAM337522 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337522 RNA, herein designated GAM RNA, and which when bound by GAM337522 RNA causes inhibition of translation of the GAM337522 target mRNA into a corresponding GAM337522 target protein.

The mechanism of the translational inhibition exerted by GAM337522 RNA, herein designated GAM RNA, on one or more GAM337522 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337522 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337522 RNA, herein designated GAM RNA, of GAM337522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337522 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337522 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337522 RNA correlate with, and may be deduced from, the identity of the GAM337522 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337523 7080 TCTTTCCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTTCCTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTCAGCAAG Messenger 337523 (GAM337523) oligonucleotides modulates expression of respective target

GCCACCTGAG genes whose function and utility is known in the art.

AACTGAATTG GAM337523 is a novel bioinformatically detectable regulatory, non protein

TAAATTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337523 was detected

CCTTGCAAGG is described with additional reference to Figs. 9-15.

AAGGGGAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCTGAAAGA encoded by the human genome.

GAM337523 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337523 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337523 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337523 precursor RNA is designated SEQ

ID:7080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7080 is located from position 128399246 to position 128399335 relative to chromosome 9 on the `+` strand.

GAM337523 precursor RNA folds onto itself, forming GAM337523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337523 precursor RNA, designated SEQ ID NO: 7080, and a schematic representation of a predicted secondary folding of GAM337523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337523 folded precursor RNA yielding a GAM337523 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337523 RNA, hereby incorporated herein.

GAM337523 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337523 target RNA, herein designated GAM TARGET RNA.

GAM337523 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337523 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337523 RNA, herein designated GAM RNA, to target binding sites on GAM337523 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337523 target RNA into GAM337523 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337523 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337523 target genes. The mRNA of each one of this plurality of GAM337523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337523 RNA, herein designated GAM RNA, and which when bound by GAM337523 RNA causes inhibition of translation of the GAM337523 target mRNA into a corresponding GAM337523 target protein.

The mechanism of the translational inhibition exerted by GAM337523 RNA, herein designated GAM RNA, on one or more GAM337523 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337523 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337523 RNA, herein designated GAM RNA, of GAM337523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337523 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337523 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337523 RNA correlate with, and may be deduced from, the identity of the GAM337523 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337524 6799 GGGATTACAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCACCTGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAAGTCTGG Messenger 337524 (GAM337524) oligonucleotides modulates expression of respective target

CTAATTTTTG genes whose function and utility is known in the art.

TATTTTTAAT GAM337524 is a novel bioinformatically detectable regulatory, non protein

AGAGACGGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337524 was detected

TTTCGCTATG is described with additional reference to Figs. 9-15.

TTGGCCAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCTCGAA encoded by the human genome.

CTCCTGATCT GAM337524 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM337524 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337524 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337524 precursor RNA is designated SEQ ID:6799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6799 is located from position 128497045 to position 128497145 relative to chromosome 8 on the `+` strand.

GAM337524 precursor RNA folds onto itself, forming GAM337524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337524 precursor RNA, designated SEQ ID NO: 6799, and a schematic representation of a predicted secondary folding of GAM337524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337524 folded precursor RNA yielding a GAM337524 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337524 RNA, hereby incorporated herein.

GAM337524 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337524 target RNA, herein designated GAM TARGET RNA.

GAM337524 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337524 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337524 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337524 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337524 RNA, herein designated GAM RNA, to target binding sites on GAM337524 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337524 target RNA into GAM337524 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337524 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337524 target genes. The mRNA of each one of this plurality of GAM337524 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337524 RNA, herein designated GAM RNA, and which when bound by GAM337524 RNA causes inhibition of translation of the GAM337524 target mRNA into a corresponding GAM337524 target protein.

The mechanism of the translational inhibition exerted by GAM337524 RNA, herein designated GAM RNA, on one or more GAM337524 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337524 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337524 RNA, herein designated GAM RNA, of GAM337524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337524 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337524 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337524 RNA correlate with, and may be deduced from, the identity of the GAM337524 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337525 6533 GCTCCTGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCATATGCAT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGTACACAG Messenger 337525 (GAM337525) oligonucleotides modulates expression of respective target

CCTGTAACTA genes whose function and utility is known in the art.

CATGTGTGTG GAM337525 is a novel bioinformatically detectable regulatory, non protein
AGCCTGTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337525 was detected
TATGTGAGGG is described with additional reference to Figs. 9-15.

GAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337525 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337525 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337525 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337525 precursor RNA is designated SEQ ID:6533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6533 is located from position 128533191 to position 128533264 relative to chromosome 8 on the `+` strand.

GAM337525 precursor RNA folds onto itself, forming GAM337525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337525 precursor RNA, designated SEQ ID NO: 6533, and a schematic representation of a predicted secondary folding of GAM337525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337525 folded precursor RNA yielding a GAM337525 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337525 RNA, hereby incorporated herein.

GAM337525 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337525 target RNA, herein designated GAM TARGET RNA.

GAM337525 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337525 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337525 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337525 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337525 RNA, herein designated GAM RNA, to target binding sites on GAM337525 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337525 target RNA into GAM337525 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337525 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337525 target genes. The mRNA of each one of this plurality of GAM337525 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337525 RNA, herein designated GAM RNA, and which when bound by GAM337525 RNA causes inhibition of translation of the GAM337525 target mRNA into a corresponding GAM337525 target protein.

The mechanism of the translational inhibition exerted by GAM337525 RNA, herein designated GAM RNA, on one or more GAM337525 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337525 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337525 RNA, herein designated GAM RNA, of GAM337525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337525 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337525 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337525 RNA correlate with, and may be deduced from, the identity of the GAM337525 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337526 6288 GAACCTTTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGTCTGGAT Messenger 337526 (GAM337526) oligonucleotides modulates expression of respective target
CTCTTTTGCC genes whose function and utility is known in the art.

TGTGAGGGAG GAM337526 is a novel bioinformatically detectable regulatory, non protein
GCAGAGAGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337526 was detected
ATTTAGGCAT is described with additional reference to Figs. 9-15.

GAGGCAGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGGTTT encoded by the human genome.

GAM337526 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337526 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337526 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337526 precursor RNA is designated SEQ ID:6288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6288 is located from position 128779961 to position 128780046 relative to chromosome 11 on the `+` strand.

GAM337526 precursor RNA folds onto itself, forming GAM337526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337526 precursor RNA, designated SEQ ID NO: 6288, and a schematic representation of a predicted secondary folding of GAM337526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337526 folded precursor RNA yielding a GAM337526 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337526 RNA, hereby incorporated herein.

GAM337526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337526 target RNA, herein designated GAM TARGET RNA.

GAM337526 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337526 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337526 RNA, herein designated GAM RNA, to target binding sites on GAM337526 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337526 target RNA into GAM337526 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337526 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337526 target genes. The mRNA of each one of this plurality of GAM337526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337526 RNA, herein designated GAM RNA, and which when bound by GAM337526 RNA causes inhibition of translation of the GAM337526 target mRNA into a corresponding GAM337526 target protein.

The mechanism of the translational inhibition exerted by GAM337526 RNA, herein designated GAM RNA, on one or more GAM337526 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337526 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337526 RNA, herein designated GAM RNA, of GAM337526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337526 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337526 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337526 RNA correlate with, and may be deduced from, the identity of the GAM337526 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337529 (GAM337529) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337529 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337529 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337529 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337529 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337529 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337529 precursor RNA is designated SEQ ID:5751, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5751 is located from position 129198494 to position 129198576 relative to chromosome 7 on the `-` strand.

GAM337529 precursor RNA folds onto itself, forming GAM337529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337529 precursor RNA, designated SEQ ID NO: 5751, and a schematic representation of a predicted secondary folding of GAM337529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337529 folded precursor RNA yielding a GAM337529 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337529 RNA, hereby incorporated herein.

GAM337529 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337529 target RNA, herein designated GAM TARGET RNA.

GAM337529 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337529 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337529 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337529 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337529 RNA, herein designated GAM RNA, to target binding sites on GAM337529 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337529 target RNA into GAM337529 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337529 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337529 target genes. The mRNA of each one of this plurality of GAM337529 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337529 RNA, herein designated GAM RNA, and which when bound by GAM337529 RNA causes inhibition of translation of the GAM337529 target mRNA into a corresponding GAM337529 target protein.

The mechanism of the translational inhibition exerted by GAM337529 RNA, herein designated GAM RNA, on one or more GAM337529 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337529 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337529 RNA, herein designated GAM RNA, of GAM337529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337529 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337529 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337529 RNA correlate with, and may be deduced from, the identity of the GAM337529 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AAGAGAAAGA is described with additional reference to Figs. 9-15.

AGAGGCTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACGAAGGAAG encoded by the human genome.

GAGG GAM337530 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337530 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337530 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337530 precursor RNA is designated SEQ ID:6112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6112 is located from position 129432365 to position 129432458 relative to chromosome 12 on the `+` strand.

GAM337530 precursor RNA folds onto itself, forming GAM337530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337530 precursor RNA, designated SEQ ID NO: 6112, and a schematic representation of a predicted secondary folding of GAM337530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337530 folded precursor RNA yielding a GAM337530 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337530 RNA, hereby incorporated herein.

GAM337530 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337530 target RNA, herein designated GAM TARGET RNA.

GAM337530 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337530 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337530 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337530 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337530 RNA, herein designated GAM RNA, to target binding sites on GAM337530 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337530 target RNA into GAM337530 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337530 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337530 target genes. The mRNA of each one of this plurality of GAM337530 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337530 RNA, herein designated GAM RNA, and which when bound by GAM337530 RNA causes inhibition of translation of the GAM337530 target mRNA into a corresponding GAM337530 target protein.

The mechanism of the translational inhibition exerted by GAM337530 RNA, herein designated GAM RNA, on one or more GAM337530 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337530 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337530 RNA, herein designated GAM RNA, of GAM337530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337530 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337530 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337530 RNA correlate with, and may be deduced from, the identity of the GAM337530 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337531 5925 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337531 (GAM337531) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337531 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337531 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337531 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337531 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337531 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337531 precursor RNA is designated SEQ

ID:5925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5925 is located from position 129487964 to position 129488045 relative to chromosome 2 on the `+` strand.

GAM337531 precursor RNA folds onto itself, forming GAM337531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337531 precursor RNA, designated SEQ ID NO: 5925, and a schematic representation of a predicted secondary folding of GAM337531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337531 folded precursor RNA yielding a GAM337531 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337531 RNA, hereby incorporated herein.

GAM337531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337531 target RNA, herein designated GAM TARGET RNA.

GAM337531 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337531 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337531 RNA, herein designated GAM RNA, to target binding sites on GAM337531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337531 target RNA into GAM337531 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337531 target genes. The mRNA of each one of this plurality of GAM337531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337531 RNA, herein designated GAM RNA, and which when bound by GAM337531 RNA causes inhibition of translation of the GAM337531 target mRNA into a corresponding GAM337531 target protein.

The mechanism of the translational inhibition exerted by GAM337531 RNA, herein designated GAM RNA, on one or more GAM337531 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337531 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337531 RNA, herein designated GAM RNA, of GAM337531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337531 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337531 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337531 RNA correlate with, and may be deduced from, the identity of the GAM337531 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337533 5926 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337533 (GAM337533) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337533 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337533 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337533 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337533 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337533 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337533 precursor RNA is designated SEQ ID:5926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5926 is located from position 129681005 to position 129681086 relative to chromosome 12 on the `-` strand.

GAM337533 precursor RNA folds onto itself, forming GAM337533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337533 precursor RNA, designated SEQ ID NO: 5926, and a schematic representation of a predicted secondary folding of GAM337533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337533 folded precursor RNA yielding a GAM337533 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337533 RNA, hereby incorporated herein.

GAM337533 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337533 target RNA, herein designated GAM TARGET RNA.

GAM337533 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337533 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337533 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337533 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337533 RNA, herein designated GAM RNA, to target binding sites on GAM337533 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337533 target RNA into GAM337533 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337533 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337533 target genes. The mRNA of each one of this plurality of GAM337533 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337533 RNA, herein designated GAM RNA, and which when bound by GAM337533 RNA causes inhibition of translation of the GAM337533 target mRNA into a corresponding GAM337533 target protein.

The mechanism of the translational inhibition exerted by GAM337533 RNA, herein designated GAM RNA, on one or more GAM337533 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337533 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337533 RNA, herein designated GAM RNA, of GAM337533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337533 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337533 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337533 RNA correlate with, and may be deduced from, the identity of the GAM337533 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337534 5927 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337534 (GAM337534) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337534 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337534 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337534 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337534 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337534 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337534 precursor RNA is designated SEQ ID:5927, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5927 is located from position 129687004 to position 129687085 relative to chromosome 12 on the `+` strand.

GAM337534 precursor RNA folds onto itself, forming GAM337534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337534 precursor RNA, designated SEQ ID NO: 5927, and a schematic representation of a predicted secondary folding of GAM337534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337534 folded precursor RNA yielding a GAM337534 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337534 RNA, hereby incorporated herein.

GAM337534 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337534 target RNA, herein designated GAM TARGET RNA.

GAM337534 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337534 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337534 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337534 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337534 RNA, herein designated GAM RNA, to target binding sites on GAM337534 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337534 target RNA into GAM337534 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337534 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337534 target genes. The mRNA of each one of this plurality of GAM337534 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337534 RNA, herein designated GAM RNA, and which when bound by GAM337534 RNA causes inhibition of translation of the GAM337534 target mRNA into a corresponding GAM337534 target protein.

The mechanism of the translational inhibition exerted by GAM337534 RNA, herein designated GAM RNA, on one or more GAM337534 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337534 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337534 RNA, herein designated GAM RNA, of GAM337534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337534 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337534 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337534 RNA correlate with, and may be deduced from, the identity of the GAM337534 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337541 6420 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGAGCTGA GAM337541 is a novel bioinformatically detectable regulatory, non protein
GACCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337541 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGAGA encoded by the human genome.

CTTGGTGTC GAM337541 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337541 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337541 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337541 precursor RNA is designated SEQ ID:6420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6420 is located from position 130940694 to position 130940792 relative to chromosome 10 on the `+` strand.

GAM337541 precursor RNA folds onto itself, forming GAM337541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337541 precursor RNA, designated SEQ ID NO: 6420, and a schematic representation of a predicted secondary folding of GAM337541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337541 folded precursor RNA yielding a GAM337541 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337541 RNA, hereby incorporated herein. Expression of GAM337541 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337541 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337541 target RNA, herein designated GAM TARGET RNA.

GAM337541 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337541 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337541 RNA, herein designated GAM RNA, to target binding sites on GAM337541 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337541 target RNA into GAM337541 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337541 target genes. The mRNA of each one of this plurality of GAM337541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337541 RNA, herein designated GAM RNA, and which when bound by GAM337541 RNA causes inhibition of translation of the GAM337541 target mRNA into a corresponding GAM337541 target protein.

The mechanism of the translational inhibition exerted by GAM337541 RNA, herein designated GAM RNA, on one or more GAM337541 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337541 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337541 RNA, herein designated GAM RNA, of GAM337541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337541 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337541 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337541 RNA correlate with, and may be deduced from, the identity of the GAM337541 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337542 6329 GAGAATTGCT TGAACCCAGG AGGTGGAGGT TGCAGTGAGC TGAGACCATG CCATTGCACT CCAGCCTGGG CAACAGAGTG AGACTT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337542 (GAM337542) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337542 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337542 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337542 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337542 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337542 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337542 precursor RNA is designated SEQ ID:6329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6329 is located from position 130940701 to position 130940786 relative to chromosome 10 on the `+` strand.

GAM337542 precursor RNA folds onto itself, forming GAM337542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337542 precursor RNA, designated SEQ ID NO: 6329, and a schematic representation of a predicted secondary folding of GAM337542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337542 folded precursor RNA yielding a GAM337542 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337542 RNA, hereby incorporated herein. Expression of GAM337542 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337542 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337542 target RNA, herein designated GAM TARGET RNA.

GAM337542 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337542 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337542 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337542 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337542 RNA, herein designated GAM RNA, to target binding sites on GAM337542 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337542 target RNA into GAM337542 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337542 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337542 target genes. The mRNA of each one of this plurality of GAM337542 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337542 RNA, herein designated GAM RNA, and which when bound by GAM337542 RNA causes inhibition of translation of the GAM337542 target mRNA into a corresponding GAM337542 target protein.

The mechanism of the translational inhibition exerted by GAM337542 RNA, herein designated GAM RNA, on one or more GAM337542 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337542 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337542 RNA, herein designated GAM RNA, of GAM337542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337542 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337542 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337542 RNA correlate with, and may be deduced from, the identity of the GAM337542 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337543 5928 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337543 (GAM337543) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337543 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337543 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337543 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337543 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337543 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337543 precursor RNA is designated SEQ ID:5928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5928 is located from position 131254288 to position 131254369 relative to chromosome 5 on the `+` strand.

GAM337543 precursor RNA folds onto itself, forming GAM337543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337543 precursor RNA, designated SEQ ID NO: 5928, and a schematic representation of a predicted secondary folding of GAM337543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337543 folded precursor RNA yielding a GAM337543 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337543 RNA, hereby incorporated herein.

GAM337543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337543 target RNA, herein designated GAM TARGET RNA.

GAM337543 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337543 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337543 RNA, herein designated GAM RNA, to target binding sites on GAM337543 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337543 target RNA into GAM337543 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337543 target genes. The mRNA of each one of this plurality of GAM337543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337543 RNA, herein designated GAM RNA, and which when bound by GAM337543 RNA causes inhibition of translation of the GAM337543 target mRNA into a corresponding GAM337543 target protein.

The mechanism of the translational inhibition exerted by GAM337543 RNA, herein designated GAM RNA, on one or more GAM337543 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337543 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337543 RNA, herein designated GAM RNA, of GAM337543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337543 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337543 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337543 RNA correlate with, and may be deduced from, the identity of the GAM337543 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337544 5929 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337544 (GAM337544) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337544 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337544 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337544 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337544 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337544 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337544 precursor RNA is designated SEQ ID:5929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5929 is located from position 131317013 to position 131317094 relative to chromosome 9 on the `+` strand.

GAM337544 precursor RNA folds onto itself, forming GAM337544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337544 precursor RNA, designated SEQ ID NO: 5929, and a schematic representation of a predicted secondary folding of GAM337544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337544 folded precursor RNA yielding a GAM337544 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337544 RNA, hereby incorporated herein.

GAM337544 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337544 target RNA, herein designated GAM TARGET RNA.

GAM337544 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337544 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337544 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337544 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337544 RNA, herein designated GAM RNA, to target binding sites on GAM337544 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337544 target RNA into GAM337544 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337544 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337544 target genes. The mRNA of each one of this

plurality of GAM337544 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337544 RNA, herein designated GAM RNA, and which when bound by GAM337544 RNA causes inhibition of translation of the GAM337544 target mRNA into a corresponding GAM337544 target protein.

The mechanism of the translational inhibition exerted by GAM337544 RNA, herein designated GAM RNA, on one or more GAM337544 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337544 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337544 RNA, herein designated GAM RNA, of GAM337544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337544 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337544 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337544 RNA correlate with, and may be deduced from, the identity of the GAM337544 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337545 6616 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 337545 (GAM337545) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATTGA GAM337545 is a novel bioinformatically detectable regulatory, non protein

GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337545 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

ACATCAGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337545 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337545 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337545 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337545 precursor RNA is designated SEQ ID:6616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6616 is located from position 131445968 to position 131446055 relative to chromosome X on the `+` strand.

GAM337545 precursor RNA folds onto itself, forming GAM337545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337545 precursor RNA, designated SEQ ID NO: 6616, and a schematic representation of a predicted secondary folding of GAM337545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337545 folded precursor RNA yielding a GAM337545 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337545 RNA, hereby incorporated herein.

GAM337545 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337545 target RNA, herein designated GAM TARGET RNA.

GAM337545 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337545 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337545 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337545 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337545 RNA, herein designated GAM RNA, to target binding sites on GAM337545 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337545 target RNA into GAM337545 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337545 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337545 target genes. The mRNA of each one of this plurality of GAM337545 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337545 RNA, herein designated GAM RNA, and which when bound by GAM337545 RNA causes inhibition of translation of the GAM337545 target mRNA into a corresponding GAM337545 target protein.

The mechanism of the translational inhibition exerted by GAM337545 RNA, herein designated GAM RNA, on one or more GAM337545 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337545 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337545 RNA, herein designated GAM RNA, of GAM337545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337545 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337545 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337545 RNA correlate with, and may be deduced from, the identity of the GAM337545 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337547 6074 CCCAGGTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CATGAATCCT Messenger 337547 (GAM337547) oligonucleotides modulates expression of respective target
TAGCATTTAG genes whose function and utility is known in the art.

TGACTCCAGT GAM337547 is a novel bioinformatically detectable regulatory, non protein
TTTGGTCTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337547 was detected
TGTCTTTCTT is described with additional reference to Figs. 9-15.

AAATGGATGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGAGGCAAC encoded by the human genome.

CATTGGGTAC GAM337547 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGGG GAM337547 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337547 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337547 precursor RNA is designated SEQ ID:6074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6074 is located from position 131841260 to position 131841363 relative to chromosome 10 on the `+` strand.

GAM337547 precursor RNA folds onto itself, forming GAM337547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337547 precursor RNA, designated SEQ ID NO: 6074, and a schematic representation of a predicted secondary folding of GAM337547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337547 folded precursor RNA yielding a GAM337547 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337547 RNA, hereby incorporated herein.

GAM337547 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337547 target RNA, herein designated GAM TARGET RNA.

GAM337547 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337547 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337547 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337547 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337547 RNA, herein designated GAM RNA, to target binding sites on GAM337547 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337547 target RNA into GAM337547 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337547 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337547 target genes. The mRNA of each one of this plurality of GAM337547 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337547 RNA, herein designated GAM RNA, and which when bound by GAM337547 RNA causes inhibition of translation of the GAM337547 target mRNA into a corresponding GAM337547 target protein.

The mechanism of the translational inhibition exerted by GAM337547 RNA, herein designated GAM RNA, on one or more GAM337547 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337547 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337547 RNA, herein designated GAM RNA, of GAM337547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337547 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337547 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337547 RNA correlate with, and may be deduced from, the identity of the GAM337547 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337548 7140 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAGGTG Messenger 337548 (GAM337548) oligonucleotides modulates expression of respective target

GCAAGGCTTG genes whose function and utility is known in the art.

CAGTGAGCTG GAM337548 is a novel bioinformatically detectable regulatory, non protein

AGATCGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337548 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGCGAG encoded by the human genome.

ACTCCAGCTC GAM337548 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM337548 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337548 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337548 precursor RNA is designated SEQ ID:7140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7140 is located from position 131845700 to position 131845800 relative to chromosome 2 on the `+` strand.

GAM337548 precursor RNA folds onto itself, forming GAM337548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337548 precursor RNA, designated SEQ ID NO: 7140, and a schematic representation of a predicted secondary folding of GAM337548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337548 folded precursor RNA yielding a GAM337548 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337548 RNA, hereby incorporated herein. Expression of GAM337548 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337548 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337548 target RNA, herein designated GAM TARGET RNA.

GAM337548 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337548 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337548 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337548 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337548 RNA, herein designated GAM RNA, to target binding sites on GAM337548 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337548 target RNA into GAM337548 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337548 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337548 target genes. The mRNA of each one of this plurality of GAM337548 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337548 RNA, herein designated GAM RNA, and which when bound by GAM337548 RNA causes inhibition of translation of the GAM337548 target mRNA into a corresponding GAM337548 target protein.

The mechanism of the translational inhibition exerted by GAM337548 RNA, herein designated GAM RNA, on one or more GAM337548 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337548 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337548 RNA, herein designated GAM RNA, of GAM337548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337548 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337548 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337548 RNA correlate with, and may be deduced from, the identity of the GAM337548 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337549 6641 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGGCAAGGC Messenger 337549 (GAM337549) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATCGC GAM337549 is a novel bioinformatically detectable regulatory, non protein
ACTACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337549 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM337549 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337549 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337549 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337549 precursor RNA is designated SEQ ID:6641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6641 is located from position 131845707 to position 131845794 relative to chromosome 2 on the `+` strand.

GAM337549 precursor RNA folds onto itself, forming GAM337549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337549 precursor RNA, designated SEQ ID NO: 6641, and a schematic representation of a predicted secondary folding of GAM337549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337549 folded precursor RNA yielding a GAM337549 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337549 RNA, hereby incorporated herein. Expression of GAM337549 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337549 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337549 target RNA, herein designated GAM TARGET RNA.

GAM337549 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337549 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337549 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337549 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337549 RNA, herein designated GAM RNA, to target binding sites on GAM337549 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337549 target RNA into GAM337549 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337549 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337549 target genes. The mRNA of each one of this plurality of GAM337549 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337549 RNA, herein designated GAM RNA, and which when bound by GAM337549 RNA causes inhibition of translation of the GAM337549 target mRNA into a corresponding GAM337549 target protein.

The mechanism of the translational inhibition exerted by GAM337549 RNA, herein designated GAM RNA, on one or more GAM337549 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337549 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337549 RNA, herein designated GAM RNA, of

GAM337549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337549 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337549 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337549 RNA correlate with, and may be deduced from, the identity of the GAM337549 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337552 7117 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATGGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 337552 (GAM337552) oligonucleotides modulates expression of respective target

GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCTG GAM337552 is a novel bioinformatically detectable regulatory, non protein

AGATTGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337552 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGCAA encoded by the human genome.

AACTCCGTCT GAM337552 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM337552 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337552 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337552 precursor RNA is designated SEQ ID:7117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7117 is located from position 132503685 to position 132503786 relative to chromosome 12 on the `-` strand.

GAM337552 precursor RNA folds onto itself, forming GAM337552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337552 precursor RNA, designated SEQ ID NO: 7117, and a schematic representation of a predicted secondary folding of GAM337552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337552 folded precursor RNA yielding a GAM337552 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337552 RNA, hereby incorporated herein. Expression of GAM337552 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337552 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337552 target RNA, herein designated GAM TARGET RNA.

GAM337552 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337552 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337552 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337552 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337552 RNA, herein designated GAM RNA, to target binding sites on GAM337552 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337552 target RNA into GAM337552 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337552 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337552 target genes. The mRNA of each one of this plurality of GAM337552 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337552 RNA, herein designated GAM RNA, and which when bound by GAM337552 RNA causes inhibition of translation of the GAM337552 target mRNA into a corresponding GAM337552 target protein.

The mechanism of the translational inhibition exerted by GAM337552 RNA, herein designated GAM RNA, on one or more GAM337552 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337552 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337552 RNA, herein designated GAM RNA, of GAM337552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337552 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337552 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337552 RNA correlate with, and may be deduced from, the identity of the GAM337552 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337553 5694 ACCAGTGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTGTATCTG GAM337553 is a novel bioinformatically detectable regulatory, non protein
TTCTGATGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337553 was detected
GGAGATTGTG is described with additional reference to Figs. 9-15.

CAGTTACATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGTAACGTCA encoded by the human genome.

TTAAACTTCA GAM337553 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTCTTCCAGG GAM337553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
T GAM337553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337553 precursor RNA is designated SEQ ID:5694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5694 is located from position 132744616 to position 132744726

relative to chromosome 8 on the `-` strand.

GAM337553 precursor RNA folds onto itself, forming GAM337553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337553 precursor RNA, designated SEQ ID NO: 5694, and a schematic representation of a predicted secondary folding of GAM337553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337553 folded precursor RNA yielding a GAM337553 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337553 RNA, hereby incorporated herein.

GAM337553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337553 target RNA, herein designated GAM TARGET RNA.

GAM337553 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337553 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337553 RNA, herein designated GAM RNA, to target binding sites on GAM337553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337553 target RNA into GAM337553 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337553 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337553 target genes. The mRNA of each one of this plurality of GAM337553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337553 RNA, herein designated GAM RNA, and which when bound by GAM337553 RNA causes inhibition of translation of the GAM337553 target mRNA into a corresponding GAM337553 target protein.

The mechanism of the translational inhibition exerted by GAM337553 RNA, herein designated GAM RNA, on one or more GAM337553 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337553 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337553 RNA, herein designated GAM RNA, of GAM337553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337553 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337553 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337553 RNA correlate with, and may be deduced from, the identity of the GAM337553 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337554 6473 GATGAGGTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GATGAAGGAG GAM337554 is a novel bioinformatically detectable regulatory, non protein
ATTGTGCAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337554 was detected
TACATGCGTA is described with additional reference to Figs. 9-15.

ACGTCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACTTCATT encoded by the human genome.

GAM337554 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337554 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337554 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337554 precursor RNA is designated SEQ ID:6473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6473 is located from position 132744625 to position 132744712 relative to chromosome 8 on the `-` strand.

GAM337554 precursor RNA folds onto itself, forming GAM337554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337554 precursor RNA, designated SEQ ID NO: 6473, and a schematic representation of a predicted secondary folding of GAM337554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337554 folded precursor RNA yielding a GAM337554 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337554 RNA, hereby incorporated herein.

GAM337554 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337554 target RNA, herein designated GAM TARGET RNA.

GAM337554 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337554 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337554 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337554 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337554 RNA, herein designated GAM RNA, to target

binding sites on GAM337554 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337554 target RNA into GAM337554 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337554 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337554 target genes. The mRNA of each one of this plurality of GAM337554 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337554 RNA, herein designated GAM RNA, and which when bound by GAM337554 RNA causes inhibition of translation of the GAM337554 target mRNA into a corresponding GAM337554 target protein.

The mechanism of the translational inhibition exerted by GAM337554 RNA, herein designated GAM RNA, on one or more GAM337554 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337554 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337554 RNA, herein designated GAM RNA, of GAM337554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337554 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337554 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337554 RNA correlate with, and may be deduced from, the identity of the GAM337554 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337555 6430 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGTGAAA encoded by the human genome.

CAATGTCTC GAM337555 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337555 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337555 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337555 precursor RNA is designated SEQ ID:6430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6430 is located from position 132911257 to position 132911355 relative to chromosome 12 on the `-` strand.

GAM337555 precursor RNA folds onto itself, forming GAM337555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337555 precursor RNA, designated SEQ ID NO: 6430, and a schematic representation of a predicted secondary folding of GAM337555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337555 folded precursor RNA yielding a GAM337555 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337555 RNA, hereby incorporated herein. Expression of GAM337555 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337555 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337555 target RNA, herein designated GAM TARGET RNA.

GAM337555 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337555 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337555 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337555 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337555 RNA, herein designated GAM RNA, to target binding sites on GAM337555 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337555 target RNA into GAM337555 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337555 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337555 target genes. The mRNA of each one of this plurality of GAM337555 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337555 RNA, herein designated GAM RNA, and which when bound by GAM337555 RNA causes inhibition of translation of the GAM337555 target mRNA into a corresponding GAM337555 target protein.

The mechanism of the translational inhibition exerted by GAM337555 RNA, herein designated GAM RNA, on one or more GAM337555 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337555 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337555 RNA, herein designated GAM RNA, of GAM337555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337555 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337555 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337555 RNA correlate with, and may be deduced from, the identity of the GAM337555 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337556 6257 CTTGAACCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTGCAGTGA Messenger 337556 (GAM337556) oligonucleotides modulates expression of respective target
GCTGAGATTG genes whose function and utility is known in the art.

CCTCACTGCA GAM337556 is a novel bioinformatically detectable regulatory, non protein
CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337556 was detected
GGCAACAGAG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337556 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337556 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337556 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337556 precursor RNA is designated SEQ ID:6257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6257 is located from position 132911271 to position 132911340 relative to chromosome 12 on the `-` strand.

GAM337556 precursor RNA folds onto itself, forming GAM337556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337556 precursor RNA, designated SEQ ID NO: 6257, and a schematic representation of a predicted secondary folding of GAM337556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337556 folded precursor RNA yielding a GAM337556 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337556 RNA, hereby incorporated herein. Expression of GAM337556 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337556 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337556 target RNA, herein designated GAM TARGET RNA.

GAM337556 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337556 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337556 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337556 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337556 RNA, herein designated GAM RNA, to target binding sites on GAM337556 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337556 target RNA into GAM337556 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337556 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337556 target genes. The mRNA of each one of this plurality of GAM337556 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337556 RNA, herein designated GAM RNA, and which when bound by GAM337556 RNA causes inhibition of translation of the GAM337556 target mRNA into a corresponding GAM337556 target protein.

The mechanism of the translational inhibition exerted by GAM337556 RNA, herein designated GAM RNA, on one or more GAM337556 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337556 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337556 RNA, herein designated GAM RNA, of GAM337556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337556 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337556 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337556 RNA correlate with, and may be deduced from, the identity of the GAM337556 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337558 5770 AGGCAGGAGA ATTGCTTGAA CCTGTGAGGC AGAGGTTGCA GTGAGCTGAG ATCATGCCAC AGCACTTCAG CCTGAGCGAC AGAGCGAGAC TCCACCT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337558 (GAM337558) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337558 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337558 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337558 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337558 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337558 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337558 precursor RNA is designated SEQ ID:5770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5770 is located from position 133234415 to position 133234511 relative to chromosome 7 on the `+` strand.

GAM337558 precursor RNA folds onto itself, forming GAM337558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337558 precursor RNA, designated SEQ ID NO: 5770, and a schematic representation of a predicted secondary folding of GAM337558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337558 folded precursor RNA yielding a GAM337558 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337558 RNA, hereby incorporated herein.

GAM337558 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337558 target RNA, herein designated GAM TARGET RNA.

GAM337558 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337558 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337558 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337558 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337558 RNA, herein designated GAM RNA, to target binding sites on GAM337558 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337558 target RNA into GAM337558 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337558 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337558 target genes. The mRNA of each one of this plurality of GAM337558 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337558 RNA, herein designated GAM RNA, and which when bound by GAM337558 RNA causes inhibition of translation of the GAM337558 target mRNA into a corresponding GAM337558 target protein.

The mechanism of the translational inhibition exerted by GAM337558 RNA, herein designated GAM RNA, on one or more GAM337558 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337558 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337558 RNA, herein designated GAM RNA, of

GAM337558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337558 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337558 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337558 RNA correlate with, and may be deduced from, the identity of the GAM337558 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337566 5930 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337566 (GAM337566) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337566 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337566 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337566 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337566 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337566 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337566 precursor RNA is designated SEQ ID:5930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5930 is located from position 135316221 to position 135316302 relative to chromosome 10 on the `-` strand.

GAM337566 precursor RNA folds onto itself, forming GAM337566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337566 precursor RNA, designated SEQ ID NO: 5930, and

a schematic representation of a predicted secondary folding of GAM337566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337566 folded precursor RNA yielding a GAM337566 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337566 RNA, hereby incorporated herein.

GAM337566 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337566 target RNA, herein designated GAM TARGET RNA.

GAM337566 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337566 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337566 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337566 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337566 RNA, herein designated GAM RNA, to target binding sites on GAM337566 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337566 target RNA into GAM337566 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337566 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337566 target genes. The mRNA of each one of this plurality of GAM337566 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337566 RNA, herein designated GAM RNA, and which when bound by GAM337566 RNA causes inhibition of translation of the GAM337566 target mRNA into a corresponding GAM337566 target protein.

The mechanism of the translational inhibition exerted by GAM337566 RNA, herein designated GAM RNA, on one or more GAM337566 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337566 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337566 RNA, herein designated GAM RNA, of GAM337566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337566 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337566 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337566 RNA correlate with, and may be deduced from, the identity of the GAM337566 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTACCGGCTA encoded by the human genome.

TTCACAGACA GAM337567 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM337567 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337567 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337567 precursor RNA is designated SEQ ID:7279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7279 is located from position 135501500 to position 135501599 relative to chromosome 8 on the `-` strand.

GAM337567 precursor RNA folds onto itself, forming GAM337567 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337567 precursor RNA, designated SEQ ID NO: 7279, and a schematic representation of a predicted secondary folding of GAM337567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337567 folded precursor RNA yielding a GAM337567 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337567 RNA, hereby incorporated herein.

GAM337567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337567 target RNA, herein designated GAM TARGET RNA.

GAM337567 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337567 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337567 RNA, herein designated GAM RNA, to target binding sites on GAM337567 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337567 target RNA into GAM337567 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337567 target genes. The mRNA of each one of this plurality of GAM337567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337567 RNA,

herein designated GAM RNA, and which when bound by GAM337567 RNA causes inhibition of translation of the GAM337567 target mRNA into a corresponding GAM337567 target protein.

The mechanism of the translational inhibition exerted by GAM337567 RNA, herein designated GAM RNA, on one or more GAM337567 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337567 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337567 RNA, herein designated GAM RNA, of GAM337567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337567 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337567 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337567 RNA correlate with, and may be deduced from, the identity of the GAM337567 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCTGCTACCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTATTC encoded by the human genome.

GAM337568 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337568 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337568 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337568 precursor RNA is designated SEQ ID:6282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6282 is located from position 135501507 to position 135501593 relative to chromosome 8 on the `-` strand.

GAM337568 precursor RNA folds onto itself, forming GAM337568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337568 precursor RNA, designated SEQ ID NO: 6282, and a schematic representation of a predicted secondary folding of GAM337568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337568 folded precursor RNA yielding a GAM337568 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337568 RNA, hereby incorporated herein.

GAM337568 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337568 target RNA, herein designated GAM TARGET RNA.

GAM337568 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337568 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337568 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337568 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337568 RNA, herein designated GAM RNA, to target binding sites on GAM337568 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337568 target RNA

into GAM337568 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337568 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337568 target genes. The mRNA of each one of this plurality of GAM337568 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337568 RNA, herein designated GAM RNA, and which when bound by GAM337568 RNA causes inhibition of translation of the GAM337568 target mRNA into a corresponding GAM337568 target protein.

The mechanism of the translational inhibition exerted by GAM337568 RNA, herein designated GAM RNA, on one or more GAM337568 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337568 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337568 RNA, herein designated GAM RNA, of GAM337568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337568 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337568 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337568 RNA correlate with, and may be deduced from, the identity of the GAM337568 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337569 5811 AGTCTGTTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTAAACATC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCCGACTGGA Messenger 337569 (GAM337569) oligonucleotides modulates expression of respective target

AGCTGTAAGA genes whose function and utility is known in the art.

CACAGCTAAG GAM337569 is a novel bioinformatically detectable regulatory, non protein

CTTTCAGTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337569 was detected

GATGTTTGCT is described with additional reference to Figs. 9-15.

GCTACCGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337569 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337569 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337569 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337569 precursor RNA is designated SEQ ID:5811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5811 is located from position 135501511 to position 135501590 relative to chromosome 8 on the `-` strand.

GAM337569 precursor RNA folds onto itself, forming GAM337569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337569 precursor RNA, designated SEQ ID NO: 5811, and a schematic representation of a predicted secondary folding of GAM337569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337569 folded precursor RNA yielding a GAM337569 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337569 RNA, hereby incorporated herein.

GAM337569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337569 target RNA, herein designated GAM TARGET RNA.

GAM337569 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337569 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337569 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337569 RNA, herein designated GAM RNA, to target binding sites on GAM337569 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337569 target RNA into GAM337569 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337569 target genes. The mRNA of each one of this plurality of GAM337569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337569 RNA, herein designated GAM RNA, and which when bound by GAM337569 RNA causes inhibition of translation of the GAM337569 target mRNA into a corresponding GAM337569 target protein.

The mechanism of the translational inhibition exerted by GAM337569 RNA, herein designated GAM RNA, on one or more GAM337569 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337569 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337569 RNA, herein designated GAM RNA, of GAM337569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337569 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337569 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337569 RNA correlate with, and may be deduced from, the identity of the GAM337569 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337570 6820 GGGTACCAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGCTTCCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTCCTCAGTA Messenger 337570 (GAM337570) oligonucleotides modulates expression of respective target

AAGAACTTGG genes whose function and utility is known in the art.

AGTATGTTGT GAM337570 is a novel bioinformatically detectable regulatory, non protein
TCCTCAAATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337570 was detected
TCTTTTGATG is described with additional reference to Figs. 9-15.

AATGGGTGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCAGGAGTTT encoded by the human genome.

CTACTGACAG GAM337570 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCTACATTTT GAM337570 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
ATCC GAM337570 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337570 precursor RNA is designated SEQ ID:6820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6820 is located from position 137087025 to position 137087138 relative to chromosome 7 on the `-` strand.

GAM337570 precursor RNA folds onto itself, forming GAM337570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337570 precursor RNA, designated SEQ ID NO: 6820, and a schematic representation of a predicted secondary folding of GAM337570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337570 folded precursor RNA yielding a GAM337570 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337570 RNA, hereby incorporated herein.

GAM337570 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337570 target RNA, herein designated GAM TARGET RNA.

GAM337570 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337570 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM337570 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337570 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337570 RNA, herein designated GAM RNA, to target binding sites on GAM337570 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337570 target RNA into GAM337570 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337570 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337570 target genes. The mRNA of each one of this plurality of GAM337570 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337570 RNA, herein designated GAM RNA, and which when bound by GAM337570 RNA causes inhibition of translation of the GAM337570 target mRNA into a corresponding GAM337570 target protein.

The mechanism of the translational inhibition exerted by GAM337570 RNA, herein designated GAM RNA, on one or more GAM337570 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337570 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337570 RNA, herein designated GAM RNA, of GAM337570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337570 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337570 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337570 RNA correlate with, and may be deduced from, the identity of the GAM337570 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337571 5739 AGATGTGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTGTCCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTAAAGAACT Messenger 337571 (GAM337571) oligonucleotides modulates expression of respective target
TGGAGTATGT genes whose function and utility is known in the art.

TGTTCCTCAA GAM337571 is a novel bioinformatically detectable regulatory, non protein
ATATCTTTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337571 was detected
ATGAATGGGT is described with additional reference to Figs. 9-15.

GCTCCAGGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCTACTGA encoded by the human genome.

CAGGCTACAT GAM337571 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TT GAM337571 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337571 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337571 precursor RNA is designated SEQ ID:5739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5739 is located from position 137087030 to position 137087131 relative to chromosome 7 on the `-` strand.

GAM337571 precursor RNA folds onto itself, forming GAM337571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337571 precursor RNA, designated SEQ ID NO: 5739, and a schematic representation of a predicted secondary folding of GAM337571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337571 folded precursor RNA yielding a GAM337571 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337571 RNA, hereby incorporated herein.

GAM337571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337571 target RNA, herein designated GAM TARGET RNA.

GAM337571 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337571 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337571 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337571 RNA, herein designated GAM RNA, to target binding sites on GAM337571 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337571 target RNA into GAM337571 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337571 target genes. The mRNA of each one of this plurality of GAM337571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337571 RNA, herein designated GAM RNA, and which when bound by GAM337571 RNA causes inhibition of translation of the GAM337571 target mRNA into a corresponding GAM337571 target protein.

The mechanism of the translational inhibition exerted by GAM337571 RNA, herein designated GAM RNA, on one or more GAM337571 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337571 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337571 RNA, herein designated GAM RNA, of GAM337571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337571 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337571 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337571 RNA correlate with, and may be deduced from, the identity of the GAM337571 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337572 6124 CCTGTCCTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTTCCTCAA genes whose function and utility is known in the art.

ATATCTTTTG GAM337572 is a novel bioinformatically detectable regulatory, non protein
ATGAATGGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337572 was detected
GCTCCAGGAG is described with additional reference to Figs. 9-15.

TTTCTACTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGG encoded by the human genome.

GAM337572 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337572 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337572 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337572 precursor RNA is designated SEQ ID:6124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6124 is located from position 137087038 to position 137087121 relative to chromosome 7 on the `-` strand.

GAM337572 precursor RNA folds onto itself, forming GAM337572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337572 precursor RNA, designated SEQ ID NO: 6124, and a schematic representation of a predicted secondary folding of GAM337572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337572 folded precursor

RNA yielding a GAM337572 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337572 RNA, hereby incorporated herein.

GAM337572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337572 target RNA, herein designated GAM TARGET RNA.

GAM337572 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337572 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337572 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337572 RNA, herein designated GAM RNA, to target binding sites on GAM337572 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337572 target RNA into GAM337572 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337572 target genes. The mRNA of each one of this plurality of GAM337572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337572 RNA, herein designated GAM RNA, and which when bound by GAM337572 RNA causes inhibition of translation of the GAM337572 target mRNA into a corresponding GAM337572 target protein.

The mechanism of the translational inhibition exerted by GAM337572 RNA, herein designated GAM RNA, on one or more GAM337572 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337572 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337572 RNA, herein designated GAM RNA, of GAM337572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337572 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337572 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337572 RNA correlate with, and may be deduced from, the identity of the GAM337572 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337573 5931 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337573 (GAM337573) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337573 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337573 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337573 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337573 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337573 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337573 precursor RNA is designated SEQ ID:5931, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5931 is located from position 137116843 to position 137116924 relative to chromosome 6 on the `-` strand.

GAM337573 precursor RNA folds onto itself, forming GAM337573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337573 precursor RNA, designated SEQ ID NO: 5931, and a schematic representation of a predicted secondary folding of GAM337573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337573 folded precursor RNA yielding a GAM337573 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337573 RNA, hereby incorporated herein.

GAM337573 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337573 target RNA, herein designated GAM TARGET RNA.

GAM337573 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337573 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337573 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337573 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337573 RNA, herein designated GAM RNA, to target binding sites on GAM337573 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337573 target RNA into GAM337573 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337573 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337573 target genes. The mRNA of each one of this plurality of GAM337573 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337573 RNA, herein designated GAM RNA, and which when bound by GAM337573 RNA causes inhibition of translation of the GAM337573 target mRNA into a corresponding GAM337573 target protein.

The mechanism of the translational inhibition exerted by GAM337573 RNA, herein designated GAM RNA, on one or more GAM337573 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337573 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337573 RNA, herein designated GAM RNA, of GAM337573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337573 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337573 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337573 RNA correlate with, and may be deduced from, the identity of the GAM337573 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337574 7126 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATAGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCAGGAG Messenger 337574 (GAM337574) oligonucleotides modulates expression of respective target

GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGTCG GAM337574 is a novel bioinformatically detectable regulatory, non protein

AGATTGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337574 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGCAA encoded by the human genome.

AACTCTGTCT GAM337574 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM337574 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337574 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337574 precursor RNA is designated SEQ ID:7126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7126 is located from position 137674434 to position 137674535 relative to chromosome 7 on the `+` strand.

GAM337574 precursor RNA folds onto itself, forming GAM337574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337574 precursor RNA, designated SEQ ID NO: 7126, and a schematic representation of a predicted secondary folding of GAM337574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337574 folded precursor RNA yielding a GAM337574 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337574 RNA, hereby incorporated herein. Expression of GAM337574 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337574 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337574 target RNA, herein designated GAM TARGET RNA.

GAM337574 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337574 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337574 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337574 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337574 RNA, herein designated GAM RNA, to target binding sites on GAM337574 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337574 target RNA into GAM337574 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337574 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337574 target genes. The mRNA of each one of this plurality of GAM337574 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337574 RNA, herein designated GAM RNA, and which when bound by GAM337574 RNA causes inhibition of translation of the GAM337574 target mRNA into a corresponding GAM337574 target protein.

The mechanism of the translational inhibition exerted by GAM337574 RNA, herein designated GAM RNA, on one or more GAM337574 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337574 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337574 RNA, herein designated GAM RNA, of GAM337574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337574 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337574 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337574 RNA correlate with, and may be deduced from, the identity of the GAM337574 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337575 6341 GAGACAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCCAGAGG Messenger 337575 (GAM337575) oligonucleotides modulates expression of respective target

TGGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCGA GAM337575 is a novel bioinformatically detectable regulatory, non protein

GATTGCACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337575 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCGAA encoded by the human genome.

ACTCCGTCTC GAM337575 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337575 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337575 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337575 precursor RNA is designated SEQ ID:6341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6341 is located from position 138359964 to position 138360063 relative to chromosome 7 on the `+` strand.

GAM337575 precursor RNA folds onto itself, forming GAM337575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337575 precursor RNA, designated SEQ ID NO: 6341, and a schematic representation of a predicted secondary folding of GAM337575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337575 folded precursor RNA yielding a GAM337575 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337575 RNA, hereby incorporated herein. Expression of GAM337575 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337575 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337575 target RNA, herein designated GAM TARGET RNA.

GAM337575 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337575 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337575 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337575 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337575 RNA, herein designated GAM RNA, to target binding sites on GAM337575 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337575 target RNA into GAM337575 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337575 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337575 target genes. The mRNA of each one of this plurality of GAM337575 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337575 RNA, herein designated GAM RNA, and which when bound by GAM337575 RNA causes inhibition of translation of the GAM337575 target mRNA into a corresponding GAM337575 target protein.

The mechanism of the translational inhibition exerted by GAM337575 RNA, herein designated GAM RNA, on one or more GAM337575 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337575 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337575 RNA, herein designated GAM RNA, of GAM337575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337575 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337575 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337575 RNA correlate with, and may be deduced from, the identity of the GAM337575 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337576 5932 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337576 (GAM337576) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337576 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337576 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337576 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337576 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337576 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337576 precursor RNA is designated SEQ ID:5932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5932 is located from position 138611911 to position 138611992 relative to chromosome 6 on the `+` strand.

GAM337576 precursor RNA folds onto itself, forming GAM337576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337576 precursor RNA, designated SEQ ID NO: 5932, and a schematic representation of a predicted secondary folding of GAM337576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337576 folded precursor RNA yielding a GAM337576 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337576 RNA, hereby incorporated herein.

GAM337576 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337576 target RNA, herein designated GAM TARGET RNA.

GAM337576 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337576 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337576 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337576 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337576 RNA, herein designated GAM RNA, to target binding sites on GAM337576 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337576 target RNA into GAM337576 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337576 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337576 target genes. The mRNA of each one of this plurality of GAM337576 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337576 RNA, herein designated GAM RNA, and which when bound by GAM337576 RNA causes inhibition of translation of the GAM337576 target mRNA into a corresponding GAM337576 target protein.

The mechanism of the translational inhibition exerted by GAM337576 RNA, herein designated GAM RNA, on one or more GAM337576 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337576 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337576 RNA, herein designated GAM RNA, of GAM337576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337576 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337576 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337576 RNA correlate with, and may be deduced from, the identity of the GAM337576 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337578 5933 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337578 (GAM337578) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337578 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337578 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337578 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337578 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337578 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337578 precursor RNA is designated SEQ ID:5933, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5933 is located from position 138845677 to position 138845758 relative to chromosome 8 on the `-` strand.

GAM337578 precursor RNA folds onto itself, forming GAM337578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337578 precursor RNA, designated SEQ ID NO: 5933, and a schematic representation of a predicted secondary folding of GAM337578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337578 folded precursor RNA yielding a GAM337578 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337578 RNA, hereby incorporated herein.

GAM337578 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337578 target RNA, herein designated GAM TARGET RNA.

GAM337578 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337578 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337578 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337578 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337578 RNA, herein designated GAM RNA, to target binding sites on GAM337578 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337578 target RNA into GAM337578 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337578 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337578 target genes. The mRNA of each one of this plurality of GAM337578 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337578 RNA, herein designated GAM RNA, and which when bound by GAM337578 RNA causes inhibition of translation of the GAM337578 target mRNA into a corresponding GAM337578 target protein.

The mechanism of the translational inhibition exerted by GAM337578 RNA, herein designated GAM RNA, on one or more GAM337578 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337578 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337578 RNA, herein designated GAM RNA, of GAM337578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337578 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337578 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337578 RNA correlate with, and may be deduced from, the identity of the GAM337578 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337579 6428 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically
AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
GCCCAGGAGG Messenger 337579 (GAM337579) oligonucleotides modulates expression of respective target
CGGAGATTGC genes whose function and utility is known in the art.

AGTGAGCCGA GAM337579 is a novel bioinformatically detectable regulatory, non protein
GATCGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337579 was detected
CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGTGAGA encoded by the human genome.

CTCTGTCTC GAM337579 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337579 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337579 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337579 precursor RNA is designated SEQ ID:6428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6428 is located from position 139758518 to position 139758616 relative to chromosome 5 on the `-` strand.

GAM337579 precursor RNA folds onto itself, forming GAM337579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337579 precursor RNA, designated SEQ ID NO: 6428, and a schematic representation of a predicted secondary folding of GAM337579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337579 folded precursor RNA yielding a GAM337579 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337579 RNA, hereby incorporated herein. Expression of GAM337579 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337579 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337579 target RNA, herein designated GAM TARGET RNA.

GAM337579 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337579 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337579 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337579 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337579 RNA, herein designated GAM RNA, to target binding sites on GAM337579 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337579 target RNA into GAM337579 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337579 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337579 target genes. The mRNA of each one of this plurality of GAM337579 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337579 RNA, herein designated GAM RNA, and which when bound by GAM337579 RNA causes inhibition of translation of the GAM337579 target mRNA into a corresponding GAM337579 target protein.

The mechanism of the translational inhibition exerted by GAM337579 RNA, herein designated GAM RNA, on one or more GAM337579 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337579 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337579 RNA, herein designated GAM RNA, of GAM337579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337579 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337579 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337579 RNA correlate with, and may be deduced from, the identity of the GAM337579 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337580 6967 TAGACTTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGGAACCTT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACAGTCCTCT Messenger 337580 (GAM337580) oligonucleotides modulates expression of respective target

ACTCCAGCTC genes whose function and utility is known in the art.

CCTGATTTTA GAM337580 is a novel bioinformatically detectable regulatory, non protein

CAGATCGGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337580 was detected

ACCCACCATT is described with additional reference to Figs. 9-15.

CAGGGCTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACAAACTCA encoded by the human genome.

GGTCTCTTCA GAM337580 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CCCTCAGTCT GAM337580 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

G GAM337580 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337580 precursor RNA is designated SEQ ID:6967, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6967 is located from position 140494572 to position 140494682 relative to chromosome 7 on the `+` strand.

GAM337580 precursor RNA folds onto itself, forming GAM337580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337580 precursor RNA, designated SEQ ID NO: 6967, and a schematic representation of a predicted secondary folding of GAM337580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337580 folded precursor RNA yielding a GAM337580 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337580 RNA, hereby incorporated herein.

GAM337580 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337580 target RNA, herein designated GAM TARGET RNA.

GAM337580 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337580 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337580 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337580 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337580 RNA, herein designated GAM RNA, to target binding sites on GAM337580 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337580 target RNA into GAM337580 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337580 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337580 target genes. The mRNA of each one of this plurality of GAM337580 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337580 RNA, herein designated GAM RNA, and which when bound by GAM337580 RNA causes inhibition of translation of the GAM337580 target mRNA into a corresponding GAM337580 target protein.

The mechanism of the translational inhibition exerted by GAM337580 RNA, herein designated GAM RNA, on one or more GAM337580 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337580 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337580 RNA, herein designated GAM RNA, of GAM337580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337580 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337580 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337580 RNA correlate with, and may be deduced from, the identity of the GAM337580 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCCAGCTACT GAM337586 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM337586 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337586 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337586 precursor RNA is designated SEQ ID:6466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6466 is located from position 141572888 to position 141572988 relative to chromosome 8 on the `+` strand.

GAM337586 precursor RNA folds onto itself, forming GAM337586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337586 precursor RNA, designated SEQ ID NO: 6466, and a schematic representation of a predicted secondary folding of GAM337586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337586 folded precursor RNA yielding a GAM337586 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337586 RNA, hereby incorporated herein.

GAM337586 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337586 target RNA, herein designated GAM TARGET RNA.

GAM337586 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337586 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337586 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337586 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337586 RNA, herein designated GAM RNA, to target binding sites on GAM337586 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337586 target RNA into GAM337586 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337586 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337586 target genes. The mRNA of each one of this plurality of GAM337586 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337586 RNA, herein designated GAM RNA, and which when bound by GAM337586 RNA causes inhibition of translation of the GAM337586 target mRNA into a corresponding GAM337586 target protein.

The mechanism of the translational inhibition exerted by GAM337586 RNA, herein designated GAM RNA, on one or more GAM337586 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337586 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337586 RNA, herein designated GAM RNA, of GAM337586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337586 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337586 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337586

RNA correlate with, and may be deduced from, the identity of the GAM337586 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337587 6241 CTGTCTGGGC Fig. 8 further provides a conceptual description of another novel bioinformatically
AACATGCTGA detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCCAGCT Messenger 337587 (GAM337587) oligonucleotides modulates expression of respective target
CTGTAAACAA genes whose function and utility is known in the art.

TACAAAAATT GAM337587 is a novel bioinformatically detectable regulatory, non protein
AGCTGGGCGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337587 was detected
GGCGGTCTGT is described with additional reference to Figs. 9-15.

GCCTACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337587 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337587 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337587 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337587 precursor RNA is designated SEQ ID:6241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6241 is located from position 141572899 to position 141572976 relative to chromosome 8 on the `+` strand.

GAM337587 precursor RNA folds onto itself, forming GAM337587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337587 precursor RNA, designated SEQ ID NO: 6241, and a schematic representation of a predicted secondary folding of GAM337587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337587 folded precursor RNA yielding a GAM337587 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337587 RNA, hereby incorporated herein.

GAM337587 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337587 target RNA, herein designated GAM TARGET RNA.

GAM337587 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337587 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337587 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337587 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337587 RNA, herein designated GAM RNA, to target binding sites on GAM337587 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337587 target RNA into GAM337587 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337587 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337587 target genes. The mRNA of each one of this plurality of GAM337587 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337587 RNA, herein designated GAM RNA, and which when bound by GAM337587 RNA causes inhibition of translation of the GAM337587 target mRNA into a corresponding GAM337587 target protein.

The mechanism of the translational inhibition exerted by GAM337587 RNA, herein designated GAM RNA, on one or more GAM337587 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337587 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337587 RNA, herein designated GAM RNA, of GAM337587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337587 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337587 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337587 RNA correlate with, and may be deduced from, the identity of the GAM337587 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337588 7290 TTCACGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AACCTGGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGGAGGTTG Messenger 337588 (GAM337588) oligonucleotides modulates expression of respective target
CAGTGAGCCG genes whose function and utility is known in the art.

AGATCATGCC GAM337588 is a novel bioinformatically detectable regulatory, non protein
ATTGCACTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337588 was detected
AGCCTGGGCA is described with additional reference to Figs. 9-15.

ACAAGAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
A encoded by the human genome.

GAM337588 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337588 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337588 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337588 precursor RNA is designated SEQ ID:7290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7290 is located from position 142629616 to position 142629696 relative to chromosome 1 on the `-` strand.

GAM337588 precursor RNA folds onto itself, forming GAM337588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337588 precursor RNA, designated SEQ ID NO: 7290, and a schematic representation of a predicted secondary folding of GAM337588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337588 folded precursor RNA yielding a GAM337588 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337588 RNA, hereby incorporated herein. Expression of GAM337588 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337588 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337588 target RNA, herein designated GAM TARGET RNA.

GAM337588 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337588 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337588 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337588 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337588 RNA, herein designated GAM RNA, to target binding sites on GAM337588 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337588 target RNA into GAM337588 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337588 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337588 target genes. The mRNA of each one of this plurality of GAM337588 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337588 RNA, herein designated GAM RNA, and which when bound by GAM337588 RNA causes inhibition of translation of the GAM337588 target mRNA into a corresponding GAM337588 target protein.

The mechanism of the translational inhibition exerted by GAM337588 RNA, herein designated GAM RNA, on one or more GAM337588 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337588 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337588 RNA, herein designated GAM RNA, of GAM337588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337588 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337588 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337588 RNA correlate with, and may be deduced from, the identity of the GAM337588 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337589 5934 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337589 (GAM337589) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337589 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337589 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337589 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337589 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337589 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337589 precursor RNA is designated SEQ ID:5934, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5934 is located from position 142638211 to position 142638292 relative to chromosome 8 on the `-` strand.

GAM337589 precursor RNA folds onto itself, forming GAM337589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337589 precursor RNA, designated SEQ ID NO: 5934, and a schematic representation of a predicted secondary folding of GAM337589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337589 folded precursor RNA yielding a GAM337589 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337589 RNA, hereby incorporated herein.

GAM337589 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337589 target RNA, herein designated GAM TARGET RNA.

GAM337589 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337589 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337589 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337589 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337589 RNA, herein designated GAM RNA, to target binding sites on GAM337589 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337589 target RNA into GAM337589 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337589 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337589 target genes. The mRNA of each one of this plurality of GAM337589 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337589 RNA, herein designated GAM RNA, and which when bound by GAM337589 RNA causes inhibition of translation of the GAM337589 target mRNA into a corresponding GAM337589 target protein.

The mechanism of the translational inhibition exerted by GAM337589 RNA, herein designated GAM RNA, on one or more GAM337589 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337589 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337589 RNA, herein designated GAM RNA, of GAM337589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337589 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337589 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337589 RNA correlate with, and may be deduced from, the identity of the GAM337589 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337590 7177 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCACATG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 337590 (GAM337590) oligonucleotides modulates expression of respective target

GTGGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM337590 is a novel bioinformatically detectable regulatory, non protein

AGACCACGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337590 was detected

ATTGCACACC is described with additional reference to Figs. 9-15.

AACCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGACTGAG encoded by the human genome.

ACTCTGTCTC GAM337590 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM337590 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337590 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337590 precursor RNA is designated SEQ

ID:7177, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7177 is located from position 142719208 to position 142719308 relative to chromosome 7 on the `+` strand.

GAM337590 precursor RNA folds onto itself, forming GAM337590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337590 precursor RNA, designated SEQ ID NO: 7177, and a schematic representation of a predicted secondary folding of GAM337590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337590 folded precursor RNA yielding a GAM337590 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337590 RNA, hereby incorporated herein.

GAM337590 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337590 target RNA, herein designated GAM TARGET RNA.

GAM337590 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337590 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337590 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337590 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337590 RNA, herein designated GAM RNA, to target binding sites on GAM337590 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337590 target RNA into GAM337590 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337590 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337590 target genes. The mRNA of each one of this plurality of GAM337590 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337590 RNA, herein designated GAM RNA, and which when bound by GAM337590 RNA causes inhibition of translation of the GAM337590 target mRNA into a corresponding GAM337590 target protein.

The mechanism of the translational inhibition exerted by GAM337590 RNA, herein designated GAM RNA, on one or more GAM337590 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337590 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337590 RNA, herein designated GAM RNA, of GAM337590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337590 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337590 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337590 RNA correlate with, and may be deduced from, the identity of the GAM337590 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337591 7302 TTCCGATAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAGTTGCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

AGACCCTTGG Messenger 337591 (GAM337591) oligonucleotides modulates expression of respective target

AAGCTCCACA genes whose function and utility is known in the art.

GTAATGGGTG GAM337591 is a novel bioinformatically detectable regulatory, non protein

TCTTTCGGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337591 was detected

TCCTGATGAG is described with additional reference to Figs. 9-15.

ATGACTGGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTGGGGGCC encoded by the human genome.

TCGAGGAGAG GAM337591 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTTCAAGTTG GAM337591 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAG GAM337591 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337591 precursor RNA is designated SEQ ID:7302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7302 is located from position 143679711 to position 143679823 relative to chromosome 7 on the `+` strand.

GAM337591 precursor RNA folds onto itself, forming GAM337591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337591 precursor RNA, designated SEQ ID NO: 7302, and a schematic representation of a predicted secondary folding of GAM337591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337591 folded precursor RNA yielding a GAM337591 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337591 RNA, hereby incorporated herein.

GAM337591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337591 target RNA, herein designated GAM TARGET RNA.

GAM337591 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337591 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337591 RNA, herein designated GAM RNA, to target binding sites on GAM337591 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337591 target RNA into GAM337591 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337591 target genes. The mRNA of each one of this plurality of GAM337591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337591 RNA, herein designated GAM RNA, and which when bound by GAM337591 RNA causes inhibition of translation of the GAM337591 target mRNA into a corresponding GAM337591 target protein.

The mechanism of the translational inhibition exerted by GAM337591 RNA, herein designated GAM RNA, on one or more GAM337591 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337591 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337591 RNA, herein designated GAM RNA, of GAM337591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337591 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337591 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337591 RNA correlate with, and may be deduced from, the identity of the GAM337591 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337592 6932 GTGTTGAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTTTCACAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGTGGTTAC Messenger 337592 (GAM337592) oligonucleotides modulates expression of respective target

AATTACGTTC genes whose function and utility is known in the art.

ACAAGCTACA GAM337592 is a novel bioinformatically detectable regulatory, non protein
CCTGCCATGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337592 was detected
GAGAATACTT is described with additional reference to Figs. 9-15.

GGCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337592 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337592 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337592 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337592 precursor RNA is designated SEQ ID:6932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6932 is located from position 143693599 to position 143693673 relative to chromosome 7 on the `+` strand.

GAM337592 precursor RNA folds onto itself, forming GAM337592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337592 precursor RNA, designated SEQ ID NO: 6932, and a schematic representation of a predicted secondary folding of GAM337592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337592 folded precursor RNA yielding a GAM337592 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337592 RNA, hereby incorporated herein.

GAM337592 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337592 target RNA, herein designated GAM TARGET RNA.

GAM337592 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337592 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337592 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM337592 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337592 RNA, herein designated GAM RNA, to target binding sites on GAM337592 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337592 target RNA into GAM337592 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337592 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337592 target genes. The mRNA of each one of this plurality of GAM337592 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337592 RNA, herein designated GAM RNA, and which when bound by GAM337592 RNA causes inhibition of translation of the GAM337592 target mRNA into a corresponding GAM337592 target protein.

The mechanism of the translational inhibition exerted by GAM337592 RNA, herein designated GAM RNA, on one or more GAM337592 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337592 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337592 RNA, herein designated GAM RNA, of GAM337592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337592 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337592 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337592 RNA correlate with, and may be deduced from, the identity of the GAM337592 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337593 5935 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337593 (GAM337593) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337593 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337593 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337593 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337593 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337593 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337593 precursor RNA is designated SEQ ID:5935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5935 is located from position 144215955 to position 144216036 relative to chromosome X on the `-` strand.

GAM337593 precursor RNA folds onto itself, forming GAM337593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337593 precursor RNA, designated SEQ ID NO: 5935, and a schematic representation of a predicted secondary folding of GAM337593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337593 folded precursor RNA yielding a GAM337593 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337593 RNA, hereby incorporated herein.

GAM337593 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337593 target RNA, herein designated GAM TARGET RNA.

GAM337593 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337593 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337593 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337593 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337593 RNA, herein designated GAM RNA, to target binding sites on GAM337593 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337593 target RNA into GAM337593 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337593 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337593 target genes. The mRNA of each one of this plurality of GAM337593 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337593 RNA, herein designated GAM RNA, and which when bound by GAM337593 RNA causes inhibition of translation of the GAM337593 target mRNA into a corresponding GAM337593 target protein.

The mechanism of the translational inhibition exerted by GAM337593 RNA, herein designated GAM RNA, on one or more GAM337593 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337593 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337593 RNA, herein designated GAM RNA, of GAM337593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337593 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337593 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337593 RNA correlate with, and may be deduced from, the identity of the GAM337593 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337594 5936 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337594 (GAM337594) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337594 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337594 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337594 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337594 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337594 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337594 precursor RNA is designated SEQ ID:5936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5936 is located from position 145082321 to position 145082402 relative to chromosome 6 on the `-` strand.

GAM337594 precursor RNA folds onto itself, forming GAM337594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337594 precursor RNA, designated SEQ ID NO: 5936, and a schematic representation of a predicted secondary folding of GAM337594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337594 folded precursor RNA yielding a GAM337594 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337594 RNA, hereby incorporated herein.

GAM337594 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337594 target RNA, herein designated GAM TARGET RNA.

GAM337594 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337594 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337594 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337594 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337594 RNA, herein designated GAM RNA, to target binding sites on GAM337594 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337594 target RNA into GAM337594 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337594 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337594 target genes. The mRNA of each one of this plurality of GAM337594 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337594 RNA, herein designated GAM RNA, and which when bound by GAM337594 RNA causes inhibition of translation of the GAM337594 target mRNA into a corresponding GAM337594 target protein.

The mechanism of the translational inhibition exerted by GAM337594 RNA, herein designated GAM RNA, on one or more GAM337594 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337594 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337594 RNA, herein designated GAM RNA, of GAM337594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337594 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337594 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337594 RNA correlate with, and may be deduced from, the identity of the GAM337594 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337595 5937 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337595 (GAM337595) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337595 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337595 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337595 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337595 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337595 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337595 precursor RNA is designated SEQ ID:5937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5937 is located from position 146634571 to position 146634652 relative to chromosome 4 on the `+` strand.

GAM337595 precursor RNA folds onto itself, forming GAM337595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337595 precursor RNA, designated SEQ ID NO: 5937, and a schematic representation of a predicted secondary folding of GAM337595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337595 folded precursor RNA yielding a GAM337595 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337595 RNA, hereby incorporated herein.

GAM337595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337595 target RNA, herein designated GAM TARGET RNA.

GAM337595 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337595 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337595 RNA, herein designated GAM RNA, to target binding sites on GAM337595 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337595 target RNA into GAM337595 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337595 target genes. The mRNA of each one of this plurality of GAM337595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337595 RNA, herein designated GAM RNA, and which when bound by GAM337595 RNA causes inhibition of translation of the GAM337595 target mRNA into a corresponding GAM337595 target protein.

The mechanism of the translational inhibition exerted by GAM337595 RNA, herein designated GAM RNA, on one or more GAM337595 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337595 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337595 RNA, herein designated GAM RNA, of GAM337595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337595 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337595 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337595 RNA correlate with, and may be deduced from, the identity of the GAM337595 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337597 7108 TGAGGCAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCAGAGGTTG genes whose function and utility is known in the art.

AAGTGAGCCG GAM337597 is a novel bioinformatically detectable regulatory, non protein
AGATCGTGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337597 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCGA encoded by the human genome.

AACTCCGTCT GAM337597 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM337597 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337597 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337597 precursor RNA is designated SEQ ID:7108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7108 is located from position 148136535 to position 148136636 relative to chromosome 7 on the `-` strand.

GAM337597 precursor RNA folds onto itself, forming GAM337597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337597 precursor RNA, designated SEQ ID NO: 7108, and a schematic representation of a predicted secondary folding of GAM337597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337597 folded precursor RNA yielding a GAM337597 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337597 RNA, hereby incorporated herein. Expression of GAM337597 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337597 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337597 target RNA, herein designated GAM TARGET RNA.

GAM337597 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337597 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337597 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337597 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337597 RNA, herein designated GAM RNA, to target binding sites on GAM337597 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337597 target RNA into GAM337597 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337597 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337597 target genes. The mRNA of each one of this plurality of GAM337597 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337597 RNA,

herein designated GAM RNA, and which when bound by GAM337597 RNA causes inhibition of translation of the GAM337597 target mRNA into a corresponding GAM337597 target protein.

The mechanism of the translational inhibition exerted by GAM337597 RNA, herein designated GAM RNA, on one or more GAM337597 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337597 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337597 RNA, herein designated GAM RNA, of GAM337597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337597 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337597 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337597 RNA correlate with, and may be deduced from, the identity of the GAM337597 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337598 6370 GAGGCAAGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGG Messenger 337598 (GAM337598) oligonucleotides modulates expression of respective target

CAGAGGTTGA genes whose function and utility is known in the art.

AGTGAGCCGA GAM337598 is a novel bioinformatically detectable regulatory, non protein

GATCGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337598 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGAGCGAA encoded by the human genome.

ACTCCGTCTC GAM337598 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337598 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337598 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337598 precursor RNA is designated SEQ ID:6370, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6370 is located from position 148136536 to position 148136635 relative to chromosome 7 on the `-` strand.

GAM337598 precursor RNA folds onto itself, forming GAM337598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337598 precursor RNA, designated SEQ ID NO: 6370, and a schematic representation of a predicted secondary folding of GAM337598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337598 folded precursor RNA yielding a GAM337598 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337598 RNA, hereby incorporated herein. Expression of GAM337598 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337598 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337598 target RNA, herein designated GAM TARGET RNA.

GAM337598 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337598 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337598 RNA, herein designated GAM RNA, to target binding sites on GAM337598 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337598 target RNA into GAM337598 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337598 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337598 target genes. The mRNA of each one of this plurality of GAM337598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337598 RNA, herein designated GAM RNA, and which when bound by GAM337598 RNA causes inhibition of translation of the GAM337598 target mRNA into a corresponding GAM337598 target protein.

The mechanism of the translational inhibition exerted by GAM337598 RNA, herein designated GAM RNA, on one or more GAM337598 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337598 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337598 RNA, herein designated GAM RNA, of GAM337598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337598 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337598 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337598 RNA correlate with, and may be deduced from, the identity of the GAM337598 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337599 6963 TACTTGTGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTTTGTTAA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATGGGTTTAT Messenger 337599 (GAM337599) oligonucleotides modulates expression of respective target

TGTGTAATGC genes whose function and utility is known in the art.

TGAGATTTGG GAM337599 is a novel bioinformatically detectable regulatory, non protein

GCTTCTAATG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337599 was detected

ATCCCATTGC is described with additional reference to Figs. 9-15.

CCAAGTAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACATAGTAC encoded by the human genome.

CTAATAGAAT GAM337599 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAATAGGTA GAM337599 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337599 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337599 precursor RNA is designated SEQ ID:6963, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6963 is located from position 148237793 to position 148237901 relative to chromosome X on the `+` strand.

GAM337599 precursor RNA folds onto itself, forming GAM337599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337599 precursor RNA, designated SEQ ID NO: 6963, and a schematic representation of a predicted secondary folding of GAM337599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337599 folded precursor RNA yielding a GAM337599 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337599 RNA, hereby incorporated herein.

GAM337599 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337599 target RNA, herein designated GAM TARGET RNA.

GAM337599 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337599 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337599 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337599 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337599 RNA, herein designated GAM RNA, to target binding sites on GAM337599 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337599 target RNA into GAM337599 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337599 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337599 target genes. The mRNA of each one of this plurality of GAM337599 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337599 RNA, herein designated GAM RNA, and which when bound by GAM337599 RNA causes inhibition of translation of the GAM337599 target mRNA into a corresponding GAM337599 target protein.

The mechanism of the translational inhibition exerted by GAM337599 RNA, herein designated GAM RNA, on one or more GAM337599 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337599 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337599 RNA, herein designated GAM RNA, of GAM337599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337599 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337599 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337599 RNA correlate with, and may be deduced from, the identity of the GAM337599 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337601 6480 GCAAAGCACT Fig. 8 further provides a conceptual description of another novel bioinformatically

TACTTCTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGATGAGAC Messenger 337601 (GAM337601) oligonucleotides modulates expression of respective target

TGAGACATAG genes whose function and utility is known in the art.

TTACAAAGTC GAM337601 is a novel bioinformatically detectable regulatory, non protein

TCAGTTTCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337601 was detected

CTGCAAACAG is described with additional reference to Figs. 9-15.

TTGTAAGTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTAGC encoded by the human genome.

GAM337601 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337601 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337601 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337601 precursor RNA is designated SEQ ID:6480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6480 is located from position 148876208 to position 148876292 relative to chromosome X on the `+` strand.

GAM337601 precursor RNA folds onto itself, forming GAM337601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337601 precursor RNA, designated SEQ ID NO: 6480, and a schematic representation of a predicted secondary folding of GAM337601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337601 folded precursor RNA yielding a GAM337601 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337601 RNA, hereby incorporated herein.

GAM337601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337601 target RNA, herein designated GAM TARGET RNA.

GAM337601 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337601 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337601 RNA, herein designated GAM RNA, to target binding sites on GAM337601 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337601 target RNA into GAM337601 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337601 target genes. The mRNA of each one of this plurality of GAM337601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337601 RNA, herein designated GAM RNA, and which when bound by GAM337601 RNA causes inhibition of translation of the GAM337601 target mRNA into a corresponding GAM337601 target protein.

The mechanism of the translational inhibition exerted by GAM337601 RNA, herein designated GAM RNA, on one or more GAM337601 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337601 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337601 RNA, herein designated GAM RNA, of GAM337601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337601 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337601 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337601 RNA correlate with, and may be deduced from, the identity of the GAM337601 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GACATAGTTA genes whose function and utility is known in the art.

CAAAGTCTCA GAM337602 is a novel bioinformatically detectable regulatory, non protein
GTTTCCTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337602 was detected
CAAACAGTTG is described with additional reference to Figs. 9-15.

TAAGTGCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM337602 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337602 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM337602 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337602 precursor RNA is designated SEQ ID:5665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5665 is located from position 148876211 to position 148876289 relative to chromosome X on the `+` strand.

GAM337602 precursor RNA folds onto itself, forming GAM337602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337602 precursor RNA, designated SEQ ID NO: 5665, and a schematic representation of a predicted secondary folding of GAM337602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337602 folded precursor RNA yielding a GAM337602 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337602 RNA, hereby incorporated herein.

GAM337602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337602 target RNA, herein designated GAM TARGET RNA.

GAM337602 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337602 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337602 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337602 RNA, herein designated GAM RNA, to target binding sites on GAM337602 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337602 target RNA into GAM337602 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337602 target genes. The mRNA of each one of this plurality of GAM337602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337602 RNA, herein designated GAM RNA, and which when bound by GAM337602 RNA causes inhibition of translation of the GAM337602 target mRNA into a corresponding GAM337602 target protein.

The mechanism of the translational inhibition exerted by GAM337602 RNA, herein designated GAM RNA, on one or more GAM337602 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337602 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337602 RNA, herein designated GAM RNA, of GAM337602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM337602 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337602 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337602 RNA correlate with, and may be deduced from, the identity of the GAM337602 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337605 7330 TTGGAGTTAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGACTCAGCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337605 was detected
ATTCTGAACC is described with additional reference to Figs. 9-15.

TTGTTTCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATCTTTGA encoded by the human genome.

GAM337605 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337605 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337605 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337605 precursor RNA is designated SEQ ID:7330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7330 is located from position 150253092 to position 150253179 relative to chromosome 7 on the `-` strand.

GAM337605 precursor RNA folds onto itself, forming GAM337605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337605 precursor RNA, designated SEQ ID NO: 7330, and a schematic representation of a predicted secondary folding of GAM337605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337605 folded precursor

RNA yielding a GAM337605 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337605 RNA, hereby incorporated herein.

GAM337605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337605 target RNA, herein designated GAM TARGET RNA.

GAM337605 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337605 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337605 RNA, herein designated GAM RNA, to target binding sites on GAM337605 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337605 target RNA into GAM337605 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337605 target genes. The mRNA of each one of this plurality of GAM337605 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337605 RNA, herein designated GAM RNA, and which when bound by GAM337605 RNA causes inhibition of translation of the GAM337605 target mRNA into a corresponding GAM337605 target protein.

The mechanism of the translational inhibition exerted by GAM337605 RNA, herein designated GAM RNA, on one or more GAM337605 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337605 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337605 RNA, herein designated GAM RNA, of GAM337605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337605 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337605 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337605 RNA correlate with, and may be deduced from, the identity of the GAM337605 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337606 (GAM337606) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337606 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337606 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337606 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337606 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337606 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337606 precursor RNA is designated SEQ ID:5978, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5978 is located from position 150584218 to position 150584325 relative to chromosome 7 on the `+` strand.

GAM337606 precursor RNA folds onto itself, forming GAM337606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337606 precursor RNA, designated SEQ ID NO: 5978, and a schematic representation of a predicted secondary folding of GAM337606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337606 folded precursor RNA yielding a GAM337606 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337606 RNA, hereby incorporated herein.

GAM337606 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337606 target RNA, herein designated GAM TARGET RNA.

GAM337606 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337606 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337606 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337606 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337606 RNA, herein designated GAM RNA, to target binding sites on GAM337606 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337606 target RNA into GAM337606 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337606 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337606 target genes. The mRNA of each one of this plurality of GAM337606 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337606 RNA, herein designated GAM RNA, and which when bound by GAM337606 RNA causes inhibition of translation of the GAM337606 target mRNA into a corresponding GAM337606 target protein.

The mechanism of the translational inhibition exerted by GAM337606 RNA, herein designated GAM RNA, on one or more GAM337606 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337606 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337606 RNA, herein designated GAM RNA, of GAM337606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337606 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337606 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337606 RNA correlate with, and may be deduced from, the identity of the GAM337606 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337607 7148 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCTGGGAG Messenger 337607 (GAM337607) oligonucleotides modulates expression of respective target

GTGGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCCG GAM337607 is a novel bioinformatically detectable regulatory, non protein

AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337607 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAGCAAAAC encoded by the human genome.

TCTGTCTCA GAM337607 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337607 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337607 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337607 precursor RNA is designated SEQ ID:7148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7148 is located from position 151095622 to position 151095720

relative to chromosome 1 on the `+` strand.

GAM337607 precursor RNA folds onto itself, forming GAM337607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337607 precursor RNA, designated SEQ ID NO: 7148, and a schematic representation of a predicted secondary folding of GAM337607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337607 folded precursor RNA yielding a GAM337607 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337607 RNA, hereby incorporated herein. Expression of GAM337607 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337607 target RNA, herein designated GAM TARGET RNA.

GAM337607 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337607 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337607 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337607 RNA, herein designated GAM RNA, to target binding sites on GAM337607 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337607 target RNA into GAM337607 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337607 target genes. The mRNA of each one of this plurality of GAM337607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337607 RNA, herein designated GAM RNA, and which when bound by GAM337607 RNA causes inhibition of translation of the GAM337607 target mRNA into a corresponding GAM337607 target protein.

The mechanism of the translational inhibition exerted by GAM337607 RNA, herein designated GAM RNA, on one or more GAM337607 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337607 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337607 RNA, herein designated GAM RNA, of GAM337607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337607 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337607 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337607 RNA correlate with, and may be deduced from, the identity of the GAM337607 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337608 6402 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAGG Messenger 337608 (GAM337608) oligonucleotides modulates expression of respective target

TGGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCGA GAM337608 is a novel bioinformatically detectable regulatory, non protein

GATCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337608 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCAAAACT encoded by the human genome.

CTGTCTC GAM337608 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337608 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337608 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337608 precursor RNA is designated SEQ ID:6402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6402 is located from position 151095623 to position 151095719 relative to chromosome 1 on the `+` strand.

GAM337608 precursor RNA folds onto itself, forming GAM337608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337608 precursor RNA, designated SEQ ID NO: 6402, and a schematic representation of a predicted secondary folding of GAM337608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337608 folded precursor RNA yielding a GAM337608 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337608 RNA, hereby incorporated herein. Expression of GAM337608 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337608 target RNA, herein designated GAM TARGET RNA.

GAM337608 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337608 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337608 RNA, herein designated GAM RNA, to target binding sites on GAM337608 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337608 target RNA into GAM337608 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337608 target genes. The mRNA of each one of this plurality of GAM337608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337608 RNA, herein designated GAM RNA, and which when bound by GAM337608 RNA causes inhibition of translation of the GAM337608 target mRNA into a corresponding GAM337608 target protein.

The mechanism of the translational inhibition exerted by GAM337608 RNA, herein designated GAM RNA, on one or more GAM337608 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337608 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337608 RNA, herein designated GAM RNA, of GAM337608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337608 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337608 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337608 RNA correlate with, and may be deduced from, the identity of the GAM337608 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337613 (GAM337613) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337613 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337613 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337613 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337613 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337613 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337613 precursor RNA is designated SEQ ID:5938, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5938 is located from position 152750152 to position 152750233 relative to chromosome 5 on the `-` strand.

GAM337613 precursor RNA folds onto itself, forming GAM337613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337613 precursor RNA, designated SEQ ID NO: 5938, and a schematic representation of a predicted secondary folding of GAM337613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337613 folded precursor RNA yielding a GAM337613 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337613 RNA, hereby incorporated herein.

GAM337613 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337613 target RNA, herein designated GAM TARGET RNA.

GAM337613 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337613 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337613 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337613 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337613 RNA, herein designated GAM RNA, to target binding sites on GAM337613 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337613 target RNA into GAM337613 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337613 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337613 target genes. The mRNA of each one of this plurality of GAM337613 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337613 RNA, herein designated GAM RNA, and which when bound by GAM337613 RNA causes inhibition of translation of the GAM337613 target mRNA into a corresponding GAM337613 target protein.

The mechanism of the translational inhibition exerted by GAM337613 RNA, herein designated GAM RNA, on one or more GAM337613 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337613 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337613 RNA, herein designated GAM RNA, of GAM337613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337613 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337613 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337613 RNA correlate with, and may be deduced from, the identity of the GAM337613 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCCCACAGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337614 was detected

ACCCCCAGGA is described with additional reference to Figs. 9-15.

CCACCTTGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGCC encoded by the human genome.

GAM337614 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337614 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337614 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337614 precursor RNA is designated SEQ ID:6851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6851 is located from position 155774514 to position 155774598 relative to chromosome 7 on the `-` strand.

GAM337614 precursor RNA folds onto itself, forming GAM337614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337614 precursor RNA, designated SEQ ID NO: 6851, and a schematic representation of a predicted secondary folding of GAM337614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337614 folded precursor RNA yielding a GAM337614 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337614 RNA, hereby incorporated herein.

GAM337614 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM337614 target RNA, herein designated GAM TARGET RNA.

GAM337614 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337614 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337614 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337614 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337614 RNA, herein designated GAM RNA, to target binding sites on GAM337614 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337614 target RNA into GAM337614 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337614 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337614 target genes. The mRNA of each one of this plurality of GAM337614 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337614 RNA, herein designated GAM RNA, and which when bound by GAM337614 RNA causes inhibition of translation of the GAM337614 target mRNA into a corresponding GAM337614 target protein.

The mechanism of the translational inhibition exerted by GAM337614 RNA, herein designated GAM RNA, on one or more GAM337614 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337614 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337614 RNA, herein designated GAM RNA, of GAM337614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337614 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337614 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337614 RNA correlate with, and may be deduced from, the identity of the GAM337614 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337615 7298 TTCCAAGTGA Fig. 8 further provides a conceptual description of another novel bioinformatically
AAATAGACTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGGAGGAG Messenger 337615 (GAM337615) oligonucleotides modulates expression of respective target
CAGAAAGGAC genes whose function and utility is known in the art.

AGCTCTTGGT GAM337615 is a novel bioinformatically detectable regulatory, non protein
ATCTTGCTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337615 was detected
CCTGAGAACT is described with additional reference to Figs. 9-15.

GCTCCAGTTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AATATATTTG encoded by the human genome.

TATTTAGAGG GAM337615 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AA GAM337615 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337615 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337615 precursor RNA is designated SEQ ID:7298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7298 is located from position 156346946 to position 156347047 relative to chromosome 7 on the `+` strand.

GAM337615 precursor RNA folds onto itself, forming GAM337615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337615 precursor RNA, designated SEQ ID NO: 7298, and a schematic representation of a predicted secondary folding of GAM337615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337615 folded precursor

RNA yielding a GAM337615 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337615 RNA, hereby incorporated herein.

GAM337615 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337615 target RNA, herein designated GAM TARGET RNA.

GAM337615 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337615 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337615 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337615 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337615 RNA, herein designated GAM RNA, to target binding sites on GAM337615 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337615 target RNA into GAM337615 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337615 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337615 target genes. The mRNA of each one of this plurality of GAM337615 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337615 RNA, herein designated GAM RNA, and which when bound by GAM337615 RNA causes inhibition of translation of the GAM337615 target mRNA into a corresponding GAM337615 target protein.

The mechanism of the translational inhibition exerted by GAM337615 RNA, herein designated GAM RNA, on one or more GAM337615 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337615 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337615 RNA, herein designated GAM RNA, of GAM337615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337615 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337615 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337615 RNA correlate with, and may be deduced from, the identity of the GAM337615 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337616 6904 GTGCATTTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTTCTAGTT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTCACGGAA Messenger 337616 (GAM337616) oligonucleotides modulates expression of respective target

CTGACCAGGC genes whose function and utility is known in the art.

AATTCAGTCA GAM337616 is a novel bioinformatically detectable regulatory, non protein

GTAGCTGTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337616 was detected

AAACTGGAGT is described with additional reference to Figs. 9-15.

CCAGAACAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAC encoded by the human genome.

GAM337616 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337616 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337616 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337616 precursor RNA is designated SEQ ID:6904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6904 is located from position 156956195 to position 156956277 relative to chromosome 7 on the `+` strand.

GAM337616 precursor RNA folds onto itself, forming GAM337616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337616 precursor RNA, designated SEQ ID NO: 6904, and a schematic representation of a predicted secondary folding of GAM337616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337616 folded precursor RNA yielding a GAM337616 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337616 RNA, hereby incorporated herein.

GAM337616 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337616 target RNA, herein designated GAM TARGET RNA.

GAM337616 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337616 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337616 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337616 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337616 RNA, herein designated GAM RNA, to target binding sites on GAM337616 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337616 target RNA into GAM337616 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337616 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337616 target genes. The mRNA of each one of this plurality of GAM337616 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337616 RNA, herein designated GAM RNA, and which when bound by GAM337616 RNA causes inhibition of translation of the GAM337616 target mRNA into a corresponding GAM337616 target protein.

The mechanism of the translational inhibition exerted by GAM337616 RNA, herein designated GAM RNA, on one or more GAM337616 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337616 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337616 RNA, herein designated GAM RNA, of GAM337616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337616 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337616 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337616 RNA correlate with, and may be deduced from, the identity of the GAM337616 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337617 7317 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 337617 (GAM337617) oligonucleotides modulates expression of respective target

TGAGCTGAGA genes whose function and utility is known in the art.

TGGTGCCACT GAM337617 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337617 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337617 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337617 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337617 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337617 precursor RNA is designated SEQ ID:7317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7317 is located from position 157286075 to position 157286150 relative to chromosome 1 on the `-` strand.

GAM337617 precursor RNA folds onto itself, forming GAM337617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337617 precursor RNA, designated SEQ ID NO: 7317, and a schematic representation of a predicted secondary folding of GAM337617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337617 folded precursor RNA yielding a GAM337617 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337617 RNA, hereby incorporated herein. Expression of GAM337617 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337617 target RNA, herein designated GAM TARGET RNA.

GAM337617 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337617 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337617 RNA, herein designated GAM RNA, to target binding sites on GAM337617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337617 target RNA into GAM337617 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337617 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM337617 target genes. The mRNA of each one of this plurality of GAM337617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337617 RNA, herein designated GAM RNA, and which when bound by GAM337617 RNA causes inhibition of translation of the GAM337617 target mRNA into a corresponding GAM337617 target protein.

The mechanism of the translational inhibition exerted by GAM337617 RNA, herein designated GAM RNA, on one or more GAM337617 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337617 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337617 RNA, herein designated GAM RNA, of GAM337617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337617 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337617 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337617 RNA correlate with, and may be deduced from, the identity of the GAM337617 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337619 5939 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337619 (GAM337619) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337619 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337619 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337619 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337619 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337619 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337619 precursor RNA is designated SEQ ID:5939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5939 is located from position 158225419 to position 158225500 relative to chromosome 2 on the `+` strand.

GAM337619 precursor RNA folds onto itself, forming GAM337619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337619 precursor RNA, designated SEQ ID NO: 5939, and a schematic representation of a predicted secondary folding of GAM337619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337619 folded precursor RNA yielding a GAM337619 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337619 RNA, hereby incorporated herein.

GAM337619 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337619 target RNA, herein designated GAM TARGET RNA.

GAM337619 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337619 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337619 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337619 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337619 RNA, herein designated GAM RNA, to target

binding sites on GAM337619 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337619 target RNA into GAM337619 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337619 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337619 target genes. The mRNA of each one of this plurality of GAM337619 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337619 RNA, herein designated GAM RNA, and which when bound by GAM337619 RNA causes inhibition of translation of the GAM337619 target mRNA into a corresponding GAM337619 target protein.

The mechanism of the translational inhibition exerted by GAM337619 RNA, herein designated GAM RNA, on one or more GAM337619 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337619 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337619 RNA, herein designated GAM RNA, of GAM337619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337619 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337619 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337619 RNA correlate with, and may be deduced from, the identity of the GAM337619 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337620 6039 CATGAAATTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGTGATTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTTTTTCTAC Messenger 337620 (GAM337620) oligonucleotides modulates expression of respective target

TTTTTAATCA genes whose function and utility is known in the art.

TCATTATTTT GAM337620 is a novel bioinformatically detectable regulatory, non protein

GAAGTTTATG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337620 was detected

is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337620 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337620 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337620 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337620 precursor RNA is designated SEQ ID:6039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6039 is located from position 159014706 to position 159014766 relative to chromosome 4 on the `+` strand.

GAM337620 precursor RNA folds onto itself, forming GAM337620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337620 precursor RNA, designated SEQ ID NO: 6039, and a schematic representation of a predicted secondary folding of GAM337620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337620 folded precursor RNA yielding a GAM337620 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337620 RNA, hereby incorporated herein. Expression of GAM337620 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337620 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337620 target RNA, herein designated GAM TARGET RNA.

GAM337620 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337620 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337620 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337620 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337620 RNA, herein designated GAM RNA, to target binding sites on GAM337620 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337620 target RNA into GAM337620 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337620 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337620 target genes. The mRNA of each one of this plurality of GAM337620 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337620 RNA, herein designated GAM RNA, and which when bound by GAM337620 RNA causes inhibition of translation of the GAM337620 target mRNA into a corresponding GAM337620 target protein.

The mechanism of the translational inhibition exerted by GAM337620 RNA, herein designated GAM RNA, on one or more GAM337620 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337620 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337620 RNA, herein designated GAM RNA, of GAM337620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337620 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337620 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337620 RNA correlate with, and may be deduced from, the identity of the GAM337620 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337621 5940 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337621 (GAM337621) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337621 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337621 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337621 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337621 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337621 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337621 precursor RNA is designated SEQ ID:5940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5940 is located from position 162284736 to position 162284817 relative to chromosome 1 on the `-` strand.

GAM337621 precursor RNA folds onto itself, forming GAM337621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337621 precursor RNA, designated SEQ ID NO: 5940, and a schematic representation of a predicted secondary folding of GAM337621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337621 folded precursor RNA yielding a GAM337621 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337621 RNA, hereby incorporated herein.

GAM337621 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337621 target RNA, herein designated GAM TARGET RNA.

GAM337621 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337621 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337621 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337621 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337621 RNA, herein designated GAM RNA, to target binding sites on GAM337621 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337621 target RNA into GAM337621 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337621 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337621 target genes. The mRNA of each one of this plurality of GAM337621 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337621 RNA, herein designated GAM RNA, and which when bound by GAM337621 RNA causes inhibition of translation of the GAM337621 target mRNA into a corresponding GAM337621 target protein.

The mechanism of the translational inhibition exerted by GAM337621 RNA, herein designated GAM RNA, on one or more GAM337621 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337621 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337621 RNA, herein designated GAM RNA, of GAM337621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337621 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337621 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337621

RNA correlate with, and may be deduced from, the identity of the GAM337621 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337622 5941 AGTTTTAGGG TACATGTGCA CAACATGCAG GTTTGTTACA TATGTATACA TGTGCCATGT TGGTGTGCTG CACCCATTAA CT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 337622 (GAM337622) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM337622 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337622 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337622 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337622 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337622 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337622 precursor RNA is designated SEQ ID:5941, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5941 is located from position 164286556 to position 164286637 relative to chromosome 6 on the `+` strand.

GAM337622 precursor RNA folds onto itself, forming GAM337622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337622 precursor RNA, designated SEQ ID NO: 5941, and a schematic representation of a predicted secondary folding of GAM337622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337622 folded precursor RNA yielding a GAM337622 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337622 RNA, hereby incorporated herein.

GAM337622 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337622 target RNA, herein designated GAM TARGET RNA.

GAM337622 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337622 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337622 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337622 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337622 RNA, herein designated GAM RNA, to target binding sites on GAM337622 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337622 target RNA into GAM337622 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337622 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337622 target genes. The mRNA of each one of this plurality of GAM337622 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337622 RNA, herein designated GAM RNA, and which when bound by GAM337622 RNA causes inhibition of translation of the GAM337622 target mRNA into a corresponding GAM337622 target protein.

The mechanism of the translational inhibition exerted by GAM337622 RNA, herein designated GAM RNA, on one or more GAM337622 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337622 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337622 RNA, herein designated GAM RNA, of GAM337622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337622 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337622 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337622 RNA correlate with, and may be deduced from, the identity of the GAM337622 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337625 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337625 precursor RNA is designated SEQ

ID:7149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7149 is located from position 171453855 to position 171453956 relative to chromosome 1 on the `+` strand.

GAM337625 precursor RNA folds onto itself, forming GAM337625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337625 precursor RNA, designated SEQ ID NO: 7149, and a schematic representation of a predicted secondary folding of GAM337625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337625 folded precursor RNA yielding a GAM337625 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337625 RNA, hereby incorporated herein. Expression of GAM337625 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337625 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337625 target RNA, herein designated GAM TARGET RNA.

GAM337625 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337625 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337625 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337625 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337625 RNA, herein designated GAM RNA, to target binding sites on GAM337625 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337625 target RNA

into GAM337625 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337625 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337625 target genes. The mRNA of each one of this plurality of GAM337625 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337625 RNA, herein designated GAM RNA, and which when bound by GAM337625 RNA causes inhibition of translation of the GAM337625 target mRNA into a corresponding GAM337625 target protein.

The mechanism of the translational inhibition exerted by GAM337625 RNA, herein designated GAM RNA, on one or more GAM337625 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337625 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337625 RNA, herein designated GAM RNA, of GAM337625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337625 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337625 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337625 RNA correlate with, and may be deduced from, the identity of the GAM337625 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337626 6716 GGAGTATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 337626 (GAM337626) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGGGATCGC GAM337626 is a novel bioinformatically detectable regulatory, non protein

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337626 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM337626 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337626 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337626 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337626 precursor RNA is designated SEQ ID:6716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6716 is located from position 176442690 to position 176442777 relative to chromosome 1 on the `-` strand.

GAM337626 precursor RNA folds onto itself, forming GAM337626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337626 precursor RNA, designated SEQ ID NO: 6716, and a schematic representation of a predicted secondary folding of GAM337626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337626 folded precursor RNA yielding a GAM337626 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337626 RNA, hereby incorporated herein. Expression of GAM337626 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337626 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337626 target RNA, herein designated GAM TARGET RNA.

GAM337626 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337626 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337626 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337626 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337626 RNA, herein designated GAM RNA, to target binding sites on GAM337626 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337626 target RNA into GAM337626 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337626 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337626 target genes. The mRNA of each one of this plurality of GAM337626 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337626 RNA, herein designated GAM RNA, and which when bound by GAM337626 RNA causes inhibition of translation of the GAM337626 target mRNA into a corresponding GAM337626 target protein.

The mechanism of the translational inhibition exerted by GAM337626 RNA, herein designated GAM RNA, on one or more GAM337626 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337626 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337626 RNA, herein designated GAM RNA, of GAM337626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337626 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337626 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337626 RNA correlate with, and may be deduced from, the identity of the GAM337626 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337627 7159 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGGCGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 337627 (GAM337627) oligonucleotides modulates expression of respective target
GCGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM337627 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337627 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGTGAG encoded by the human genome.

ACTCCGTCTC GAM337627 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM337627 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337627 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337627 precursor RNA is designated SEQ ID:7159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7159 is located from position 177506687 to position 177506787 relative to chromosome 1 on the `+` strand.

GAM337627 precursor RNA folds onto itself, forming GAM337627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337627 precursor RNA, designated SEQ ID NO: 7159, and a schematic representation of a predicted secondary folding of GAM337627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337627 folded precursor RNA yielding a GAM337627 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337627 RNA, hereby incorporated herein. Expression of GAM337627 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337627 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337627 target RNA, herein designated GAM TARGET RNA.

GAM337627 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337627 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337627 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337627 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337627 RNA, herein designated GAM RNA, to target binding sites on GAM337627 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337627 target RNA into GAM337627 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337627 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337627 target genes. The mRNA of each one of this plurality of GAM337627 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337627 RNA, herein designated GAM RNA, and which when bound by GAM337627 RNA causes inhibition of translation of the GAM337627 target mRNA into a corresponding GAM337627 target protein.

The mechanism of the translational inhibition exerted by GAM337627 RNA, herein designated GAM RNA, on one or more GAM337627 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337627 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337627 RNA, herein designated GAM RNA, of GAM337627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337627 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337627 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337627 RNA correlate with, and may be deduced from, the identity of the GAM337627 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337628 5943 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 337628 (GAM337628) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337628 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337628 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337628 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337628 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337628 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337628 precursor RNA is designated SEQ ID:5943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5943 is located from position 182133354 to position 182133435 relative to chromosome 1 on the `-` strand.

GAM337628 precursor RNA folds onto itself, forming GAM337628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337628 precursor RNA, designated SEQ ID NO: 5943, and a schematic representation of a predicted secondary folding of GAM337628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337628 folded precursor RNA yielding a GAM337628 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337628 RNA, hereby incorporated herein.

GAM337628 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337628 target RNA, herein designated GAM TARGET RNA.

GAM337628 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337628 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337628 RNA, herein designated GAM RNA, to target binding sites on GAM337628 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337628 target RNA into GAM337628 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337628 target genes. The mRNA of each one of this plurality of GAM337628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337628 RNA, herein designated GAM RNA, and which when bound by GAM337628 RNA causes inhibition of translation of the GAM337628 target mRNA into a corresponding GAM337628 target protein.

The mechanism of the translational inhibition exerted by GAM337628 RNA, herein designated GAM RNA, on one or more GAM337628 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337628 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337628 RNA, herein designated GAM RNA, of GAM337628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337628 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337628 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337628 RNA correlate with, and may be deduced from, the identity of the GAM337628 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337629 5944 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 337629 (GAM337629) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337629 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337629 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337629 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337629 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337629 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337629 precursor RNA is designated SEQ ID:5944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5944 is located from position 186079835 to position 186079916 relative to chromosome 4 on the `+` strand.

GAM337629 precursor RNA folds onto itself, forming GAM337629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337629 precursor RNA, designated SEQ ID NO: 5944, and a schematic representation of a predicted secondary folding of GAM337629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337629 folded precursor RNA yielding a GAM337629 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337629 RNA, hereby incorporated herein.

GAM337629 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337629 target RNA, herein designated GAM TARGET RNA.

GAM337629 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337629 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337629 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337629 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337629 RNA, herein designated GAM RNA, to target binding sites on GAM337629 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337629 target RNA into GAM337629 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337629 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337629 target genes. The mRNA of each one of this plurality of GAM337629 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337629 RNA, herein designated GAM RNA, and which when bound by GAM337629 RNA causes inhibition of translation of the GAM337629 target mRNA into a corresponding GAM337629 target protein.

The mechanism of the translational inhibition exerted by GAM337629 RNA, herein designated GAM RNA, on one or more GAM337629 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337629 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM337629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337629 RNA, herein designated GAM RNA, of GAM337629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337629 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337629 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337629 RNA correlate with, and may be deduced from, the identity of the GAM337629 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337630 5767 AGGCAGAAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGCTGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTAGGAGGC Messenger 337630 (GAM337630) oligonucleotides modulates expression of respective target

GGAGGTTGCA genes whose function and utility is known in the art.

GTGAGCCAAG GAM337630 is a novel bioinformatically detectable regulatory, non protein

ATCGCGCCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337630 was detected

TGCACTCCAG is described with additional reference to Figs. 9-15.

CCTGGGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGCGAGAC encoded by the human genome.

TCTGTCT GAM337630 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337630 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337630 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337630 precursor RNA is designated SEQ ID:5767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5767 is located from position 199201991 to position 199202087 relative to chromosome 1 on the `+` strand.

GAM337630 precursor RNA folds onto itself, forming GAM337630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337630 precursor RNA, designated SEQ ID NO: 5767, and a schematic representation of a predicted secondary folding of GAM337630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337630 folded precursor RNA yielding a GAM337630 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337630 RNA, hereby incorporated herein. Expression of GAM337630 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337630 target RNA, herein designated GAM TARGET RNA.

GAM337630 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337630 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337630 RNA, herein designated GAM RNA, to target binding sites on GAM337630 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337630 target RNA into GAM337630 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337630 target genes. The mRNA of each one of this plurality of GAM337630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337630 RNA,

herein designated GAM RNA, and which when bound by GAM337630 RNA causes inhibition of translation of the GAM337630 target mRNA into a corresponding GAM337630 target protein.

The mechanism of the translational inhibition exerted by GAM337630 RNA, herein designated GAM RNA, on one or more GAM337630 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337630 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337630 RNA, herein designated GAM RNA, of GAM337630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337630 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337630 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337630 RNA correlate with, and may be deduced from, the identity of the GAM337630 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337631 6629 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGAGG Messenger 337631 (GAM337631) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATCAT GAM337631 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337631 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM337631 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337631 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337631 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337631 precursor RNA is designated SEQ ID:6629, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6629 is located from position 208756916 to position 208757003 relative to chromosome 1 on the `+` strand.

GAM337631 precursor RNA folds onto itself, forming GAM337631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337631 precursor RNA, designated SEQ ID NO: 6629, and a schematic representation of a predicted secondary folding of GAM337631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337631 folded precursor RNA yielding a GAM337631 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337631 RNA, hereby incorporated herein. Expression of GAM337631 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337631 target RNA, herein designated GAM TARGET RNA.

GAM337631 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337631 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337631 RNA, herein designated GAM RNA, to target binding sites on GAM337631 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337631 target RNA into GAM337631 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337631 target genes. The mRNA of each one of this plurality of GAM337631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337631 RNA, herein designated GAM RNA, and which when bound by GAM337631 RNA causes inhibition of translation of the GAM337631 target mRNA into a corresponding GAM337631 target protein.

The mechanism of the translational inhibition exerted by GAM337631 RNA, herein designated GAM RNA, on one or more GAM337631 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337631 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337631 RNA, herein designated GAM RNA, of GAM337631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337631 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337631 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337631 RNA correlate with, and may be deduced from, the identity of the GAM337631 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337632 5730 AGAGGGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCTTGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGGATTTC Messenger 337632 (GAM337632) oligonucleotides modulates expression of respective target

GAGGCTGCAG genes whose function and utility is known in the art.

TGAGCTATGA GAM337632 is a novel bioinformatically detectable regulatory, non protein

TCACACCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337632 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCAAGACT encoded by the human genome.

CTGTCT GAM337632 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337632 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337632 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337632 precursor RNA is designated SEQ ID:5730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5730 is located from position 222613184 to position 222613279 relative to chromosome 2 on the `+` strand.

GAM337632 precursor RNA folds onto itself, forming GAM337632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337632 precursor RNA, designated SEQ ID NO: 5730, and a schematic representation of a predicted secondary folding of GAM337632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337632 folded precursor RNA yielding a GAM337632 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337632 RNA, hereby incorporated herein. Expression of GAM337632 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337632 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337632 target RNA, herein designated GAM TARGET RNA.

GAM337632 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337632 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337632 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337632 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337632 RNA, herein designated GAM RNA, to target binding sites on GAM337632 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337632 target RNA into GAM337632 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337632 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337632 target genes. The mRNA of each one of this plurality of GAM337632 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337632 RNA, herein designated GAM RNA, and which when bound by GAM337632 RNA causes inhibition of translation of the GAM337632 target mRNA into a corresponding GAM337632 target protein.

The mechanism of the translational inhibition exerted by GAM337632 RNA, herein designated GAM RNA, on one or more GAM337632 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337632 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337632 RNA, herein designated GAM RNA, of GAM337632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337632 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337632 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337632 RNA correlate with, and may be deduced from, the identity of the GAM337632 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337633 6445 GAGGGAGAAT Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGGATTTCG Messenger 337633 (GAM337633) oligonucleotides modulates expression of respective target
AGGCTGCAGT genes whose function and utility is known in the art.

GAGCTATGAT GAM337633 is a novel bioinformatically detectable regulatory, non protein
CACACCACTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337633 was detected
CACTCCAGCC is described with additional reference to Figs. 9-15.

TGGGCAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCAAGACTC encoded by the human genome.

TGTC GAM337633 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337633 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337633 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337633 precursor RNA is designated SEQ ID:6445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6445 is located from position 222613185 to position 222613278 relative to chromosome 2 on the `+` strand.

GAM337633 precursor RNA folds onto itself, forming GAM337633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337633 precursor RNA, designated SEQ ID NO: 6445, and a schematic representation of a predicted secondary folding of GAM337633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337633 folded precursor RNA yielding a GAM337633 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337633 RNA, hereby incorporated herein. Expression of GAM337633 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337633 target RNA, herein designated GAM TARGET RNA.

GAM337633 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337633 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337633 RNA, herein designated GAM RNA, to target binding sites on GAM337633 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337633 target RNA into GAM337633 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337633 target genes. The mRNA of each one of this plurality of GAM337633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337633 RNA, herein designated GAM RNA, and which when bound by GAM337633 RNA causes inhibition of translation of the GAM337633 target mRNA into a corresponding GAM337633 target protein.

The mechanism of the translational inhibition exerted by GAM337633 RNA, herein designated GAM RNA, on one or more GAM337633 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337633 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337633 RNA, herein designated GAM RNA, of GAM337633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337633 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337633 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337633 RNA correlate with, and may be deduced from, the identity of the GAM337633 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337634 6667 GGAGAATCTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 337634 (GAM337634) oligonucleotides modulates expression of respective target
TTGGGGTGAG genes whose function and utility is known in the art.

CCGAGACCGC GAM337634 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337634 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGACTCC encoded by the human genome.

GAM337634 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337634 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337634 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337634 precursor RNA is designated SEQ ID:6667, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6667 is located from position 231956115 to position 231956203 relative to chromosome 1 on the `+` strand.

GAM337634 precursor RNA folds onto itself, forming GAM337634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337634 precursor RNA, designated SEQ ID NO: 6667, and a schematic representation of a predicted secondary folding of GAM337634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337634 folded precursor RNA yielding a GAM337634 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337634 RNA, hereby incorporated herein. Expression of GAM337634 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337634 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337634 target RNA, herein designated GAM TARGET RNA.

GAM337634 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337634 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337634 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337634 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337634 RNA, herein designated GAM RNA, to target binding sites on GAM337634 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337634 target RNA into GAM337634 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337634 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337634 target genes. The mRNA of each one of this plurality of GAM337634 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337634 RNA, herein designated GAM RNA, and which when bound by GAM337634 RNA causes inhibition of translation of the GAM337634 target mRNA into a corresponding GAM337634 target protein.

The mechanism of the translational inhibition exerted by GAM337634 RNA, herein designated GAM RNA, on one or more GAM337634 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337634 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337634 RNA, herein designated GAM RNA, of GAM337634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337634 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337634 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337634 RNA correlate with, and may be deduced from, the identity of the GAM337634 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.
